Introduction

Institute of Statistics is pleased to present to the users the Statistical Yearbook 2012-2016.

This publication is an extensive overview of the most important statistical indicators. The Statistical Yearbook provides an overview of the current socio-economic situation of Albanian society, dedicated to the all users of statistical data, decision-makers, administrators, community businesses, researchers etc.

This publication comes in a format that follows the example and experience of European countries.

The main purpose is to provide a full summary of social and economic statistics in a single volume for a period of 5 years. The statistics presented in the Statistical Yearbook were issued by the specialized sectors of the Institute of Statistics.

In this edition of 177 pages are summarized statistical data and indicators for economy, environment, agriculture etc. Divided into 18 chapters the users can find a combination of text tables and graphs, to make this publication more understandable.

Due to the considerable number of indicators and data, the Statistical Yearbook remains one of the most important publications of the Institute of Statistics. It's an instrument that guides the users in the variety of data produced, an instrument that INSTAT will improve and update in order to answer the ever-increasing demand for information of our society.

The publication is also available in electronic format, to facilitate its use.

We thank all the institutions that contributed with the information to expand the content of this Yearbook and we would kindly ask for everyone's contribution to improve this publication.

PhD Delina IBRAHIMAJ

POPULATION

Introduction

This chapter provides an overview of recent developments in the Albanian population, taking into account some of the key demographic indicators, including information on changes in population over the period 2012-2016, population density, fertility, life expectancy and total age dependency rate. Presented indicators suggest a slight decrease of population during the given period, which is approaching the aging process as a result of increasing life expectancy as well as fertility that still remains below replacement level.

Population and population change

The latest demographic developments show that Albanian population is decreasing, while population structure shows that population is moving towards aging process. This comes due to an increasing in life expectancy on one hand and fertility which even though is increasing slightly, it still remains below replacement level, on the other hand.

Population density in the mid of 2016 is 100 inhabitants per km², it has a slightly decrease throughout the last five years.

Table 1: Average population by sex and density, 2012-2016

		Average population (thousand)	Density
2012	Total	2,900	100.9
	Male	1,460	
	Female	1,441	
2013	Total	2,895	100.7
	Male	1,461	
	Female	1,434	
2014	Total	2,889	100.5
	Male	1,461	
	Female	1,428	
2015	Total	2,881	100.2
	Male	1,460	
	Female	1,421	
2016	Total	2,876	100.0
	Male	1,456	
	Female	1,420	

As of January 1, 2012 until January 1, 2017 the population of our country has decreased by some 26 thousand inhabitants, this is equivalent to an annually increasing rate negative of 0.18 %.

Figure 1: Population by sex, 2012-2016

Population change is the result of two components: natural increase and net migration. Natural increase of population has experienced a decrease during the last two years, this happened due to the decreasing of the number of births and the increasing of number of deaths.

Figure 2: Births, deaths and natural increase, 2012-2016

Negative net migration (outflows exceed inflows) has played an essential role in the population decline of the country, but the natural increase in 2016 was able to fill the gap caused by the net migration. *Figure 3* shows

population changes as a result of two main components. As it may be seen, not necessarily the changes in the natural increase follow the population change and this because an important impact in population change is given by the net migration balance.

Figure 3: Population change components, 2012-2016

Population structure

In 2016, in the average total population of Albania, young persons (0-14 years) occupied 18.3 %, the working age population 15-64 is estimated two-thirds (68.7 %) of the total population, while the population over 65 years occupied 13.0 % of the total. Figure 4 reflects the trend of developments that have occurred for the age groups in question. The

age group that dominates in the total population is the population of working age 15-64 which during the years 2011-2015 has undergone slight fluctuations. The tendency towards aging process in the future is noticed by a slight increase in proportion of population aged 65 and over, associated with the reduction in the number of young people (0-14 years).

Figure 4: Average population by three broad age group, 2012-2016

This trend is supported by the population projection. It is expected to have a reduction in population number of the age group 0-14 years and 15-64 years, so in 2060 the age

group 15-64 is expected to reach about 1.4 million from 2.0 million in 2016. While the age groups 65-79 and 80+ are expected to increase during the period in question.

Figure 5: Population projections by broad age group, 2021-2060

The table below shows the total age dependency ratios, which are indicators that analyse more deeply the population structure. The age dependency ratio are calculated by a comparison of the number of dependent persons (youngsters aged 0-14 years old and/ or elderly people aged 65+ years old) with the working age population. In 2016

the old age dependency ratio in Albania is 18.9 % against 16.8 % in 2012. The old age dependency ratio expresses an increasing trend throughout the years, showing an increasing weight to the working age population. Young age dependency ratio in 2016 is 26.7% against 29.9% in 2012, showing a downward trend of this ratio in our country.

Table 2: Indicators of population structure, 2012-2016

	Mean age	Young age dependency ratio	Old age dependency ratio	Total age dependency ratio
	(years)		(%)	
2012	35.3	29.9	16.8	46.7
2013	35.8	29.0	17.3	46.3
2014	36.2	28.2	17.9	46.0
2015	36.6	27.3	18.4	45.7
2016	37.0	26.7	18.9	45.5

Population pyramids show the distribution of population by sex and age. Each column corresponds to the proportion of population with respective age and gender. They are a very good indicator regarding the study of changes in the population structure. Figure 6 shows the projected changes in the structure of the population for the upcoming years, by comparing 2017 with 2060 population structures. The

population pyramids of 2016 and 2060 show that the population of Albania is projected to continue to grow old. In the coming decades the high number of baby-boomers (those born around 1960) will increase the number of old population. So it shows how this numerous part of the population moved up while the middle and the base of the pyramid are projected to shrink significantly by 2060.

Figure 6: Population pyramids, 2012-2017

Figure 7: Population pyramids, 2017-2060

Median and the mean age of the population are indicators that show clear trends towards aging of our population. It is observed a significant increase in median age, which marks 35 years in 2016 from 32 years that has been in 2012. The

median age 35 years shows that half of the total population is younger than this age and the other half older. On the other hand the mean age marks 37 years in 2016, which is higher than that of 2012 by about 2 years.

Figure 8: Mean age and median age of population, 2012-2016

Marriages and divorces

The figure below illustrates crude marriage and divorce rates expressed per 1.000 inhabitants. In 2016, 23 thousand marriages are recorded in the civil registration offices, or expressed as crude rate, 7.8 marriages per 1.000 thousands inhabitants. This coefficient has fluctuated during the period 2012-2016 and experienced a decrease in 2016.

In 2016, divorces noticed an increase with 5,582 cases from 3,561 divorces expressed per 1.000 inhabitants 1.3 divorces. Over the years 2012-2016 it can be noticed a gradually increase from 1.2 divorces per 1.000 inhabitants in 2012, on 1.9 divorces per 1.000 inhabitants in 2016.

Figure 9: Crude rate of marriages and divorces, 2012-2016

Did you know?

During this period 2012-2016, the favourite month for Albanians to marry is August, followed by September, December and January.

Table 3: Marriages by marriage month, 2012-2016

Months	2012	2013	2014	2015	2016
Total	22,891	23,820	23,769	24,997	22,562
January	2,340	2,168	2,207	2,221	1,894
February	1,485	1,820	1,792	1,844	1,741
March	1,598	1,780	1,758	1,975	1,711
April	1,876	1,894	1,840	2,024	1,599
May	1,672	1,756	1,690	1,748	1,710
June	1,426	1,583	1,568	1,979	1,433
July	1,737	1,841	1,627	2,222	1,573
August	2,898	2,769	2,732	3,050	2,811
September	2,059	2,255	2,359	2,207	2,110
October	2,037	2,059	2,158	2,075	2,135
November	1,672	1,756	1,721	1,668	1,809
December	2,091	2,139	2,317	1,984	2,036

Fertility

Women are delivering less children thus slowing down the natural population increase. In 2012 this indicator was 1.72 live births per women maintaining almost the same value till in 2014 with 1.78 live births per women, after 2014 this indicator has decreased at 1.54 live births per women in 2016. Although this indicator marks slightly increase, it

is still under 2.1 children per women. The rate of 2.1 live births per woman is considered the replacement level for most developed countries. In other words, with this rate, we would have a stationery population in the long-term, if the incoming or outgoing migration flows are not considered.

Figure 10: Total fertility rate, 2012-2016

Considering the age specific fertility rate (live births per 1.000 women), the highest number of births is among

women aged 25-29 years, followed by those aged 20-24 years. While the lowest number of births is marked for women aged 40 years and over.

Figure 11: Age specific fertility rate, 2012-2016

Births by month during 2012-2016 period show that September marks the highest number of births.

Table 4: Births by month of birth, 2012-2016

Manths	2012	2013	2014	2015	2016
Total	35,473	35,750	35,760	32,715	31,733
January	2,939	2,839	2,837	2,742	2,517
February	2,507	2,408	2,491	2,350	2,274
March	2,636	2,621	2,674	2,554	2,372
April	2,574	2,450	2,708	2,489	2,269

June	3,016	3,062	3,078	2,736	2,640
July	3,385	3,451	3,519	2,986	2,999
August	3,420	3,258	3,273	2,733	2,946
September	3,452	3,499	3,537	2,996	3,141
October	3,157	3,429	3,165	2,923	2,882
November	2,722	2,949	2,776	2,596	2,580
December	2,784	2,914	2,747	2,844	2,657

Deaths and life expectancy

In 2016 life expectancy for women is 80.1 years and 77.0 years for men. It is noted that women live longer than men. It should be noted that for the last year, the life expectancy for both sexes has experienced an increase, but this increase is higher in men than in women.

Figure 12: Life expectancy at birth by sex, 2012-2016

Over this period sex differences in life expectancy at birth has been decreasing, so in 2016 the difference in life expectancy between women and men is 3.0 years, while in 2012 this gender gap was 4.2 year.

Figure 13: Life expectancy at birth, gender differences, 2012-2016

In 2016 the Civil Status Offices recorded about 21.4 thousand death in total in our country, about 4.6 % more deaths compare with one year before or 2.5 % more deaths than in 2012.

Regarding infant deaths during this period of five years, their number has decreased by 233 infant deaths in 2015, while there is an increase by 277 in 2016. The number of infant deaths during the period 2012-2016 is higher at men that women.

Figure 14: Infant deaths by sex, 2012-2016

Data Sources

INSTAT collects a wide range of demographic data including population statistics at national and regional level, and also data on demographic events which have an impact on the size and structure of the population. The main data sources for the directorate of social statistics to attain the objectives in the calculation of the specific indicators are the administrative data and Population and Housing Censuses. Administrative sources:

Administrative resources:

- Births, deaths and marriages

Information about the births, deaths, and marriages is submitted electronically by the General Directorate of Civil Registration Offices. Such means of data transmission of demographic events ensures greater completeness and meeting the deadline of respective publications.

- Population and housing Census

The census of population and housing 2011, is a very important source for the population statistics. It is the basis for the annual population estimations.

Definitions

Vital statistics: are demographic data on the births, deaths, infant mortality and marriages.

Live birth: is the birth of children showing signs of life. It is the number of births, excluding stillbirths.

Death: Implies the permanent disappearance of all evidence of life at any time after live birth has taken place (postnatal cessation of vital functions without capability of resuscitation).

Natural increase in population: is the increase/decline in population as a result of the biological processes (births and deaths) during a period of time. The difference between the number of live births and the number of deaths during a given year is the natural increase in population in that given year.

Population density: is the number of population per unit of total land area of a country. (per km²)

Population growth rate: is the rate by which a population is increasing (or decreasing) in a given year because of the difference of the natural increase and net migration, expressed as a percentage to the base population.

Total age dependency ratio: Ratio of the number of persons under working age (0-14 years of age) and older persons above working age (65+), with the number of active persons (from 15 to 64 years of age) expressed as percentage.

Age dependency ratio of young people: Ratio of the number of persons under working age (0-14 years of age) with the number of active persons (from 15 to 64 years of age) expressed as percentage.

Age dependency ratio of elderly people: Ratio of the number of persons above the working age (65+ years of age) with the number of active persons (from 15 to 64 years of age) expressed as percentage.

Net migration: is the difference between immigration and emigration of the population of a specific territory in a given period of time.

Crude marriage rate: is the number of marriages per 1 000 inhabitants in a specific territory in a given year.

Crude divorces rate: is the number of divorces per 1 000 inhabitants in a specific territory in a given year.

Total fertility rate: The average number of children a woman can bear during her reproductive period 15-49 years old.

The average life expectancy at birth: The average number of years a born today can expect to live, considering current mortality rates.

LEGAL STATISTICS

Introduction

This section presents latest statistics on criminality in country (recorded penal offences, perpetrators and damaged persons), prisoners and convicted persons for the years 2012-2016.

Main finding

Recorded penal offences

Acts that violated, damaged legal human values and society are called penal offences or in general term crimes.

During 2016 were recorded in total 33,808 penal offences, with and decrease of 5.7 % compare to 2015, or expressed in absolute value 2,056 less recorded offences. These recorded cases are related to incidents as occurred, and not to the trials, the verdict of which is given by the law bodies.

Figure 1 presents information on the distribution of crime in the country, it expresses crime rate per 10 thousand inhabitants. This rate indicates the number of offences per 10 thousand inhabitants, placing these offences in relation to the resident population of the social environment in which conducted this criminal act. In the year 2016 this rate marks 117,4 recorded penal offences per 10 thousand inhabitants. Over the years, this rate has increased, while 2016 marks a decrease of this rate.

Figure 2 illustrates the performance of several offences over the years by comparing with a base year, in this case the year 2012. The number of offences on Drug Crimes and Violation of road traffic rules have increased considerably in comparison to 2012, 196 % and 161 % respectively. The number of offences on Robbery and have increased until 2014 and then has decreased. In 2016, the number of Robberies has decreased by 9.4%, compared to 2012. The same trend is shown also for Corruption Crimes. In 2016 the number of Corruption crimes has decreased by 29.4% compared to 2012.

Homicides are presented in Figure 3, which illustrates the rate of homicides per 100 thousand inhabitants. Here are included intentional homicides and manslaughter (negligent homicides). The figure shows that the trend of homicide has decreased, where the year 2015 marks the lowest rate about 2 homicides per 100 thousand inhabitants. While in 2016 this rate is increased, 2,6 homicides per 100 thousand inhabitants.

Table 1: Recorded penal offences, 2012– 2016

Perpetrators

Data on perpetrators are provided by the General Directorate of Police, and are related to suspected persons in committing an offence.

Table 2 presents perpetrators of criminal offences during this period of five years 2012-2016. During 2016 there were recorded a total of 33,426 perpetrators, about 1.9 % less compare to 2015.

Figure 4 illustrates the attrition ratio, the percentage of suspected persons that are found guilty by a court decision. During these years this rate fluctuates in the same levels. The year 2016 marks 42.7 % of perpetrators are convicted in courts.

In 2016 there have been 108.6 perpetrators per 10 thousand inhabitants. From figure 7 is seen an increase of this rate in years, where 2015 marks the highest value.

Table 2: Perpetrators by penal offences, 2012-2016

Criminal offences	2012	2013	2014	2015	2016
Homicide	162	123	110	81	80

Figure 4: Suspect attrition rate, 2012-2016

*) General Directorate of Police

Damaged persons

Attention should be paid not only to recorded penal offences or the perpetrators, but also to protect the position of the person injured by the commission of the offense. The damaged person is any person to whom any personal or property right has been violated or endangered by a criminal act.

During 2016 are recorded a total of 19,078 damaged persons, about 5.4 % less than in the previous year.

Figure 7 provides an overview of penal offenses, the perpetrators and the damaged persons over the years 2012-2016.

Table3: Damaged persons by penal offences, 2012-2016

Domestic violence

Table 4 presents the reported domestic violence, requests for protection orders and the number of suspected persons. From the table we noted that reported cases have increased over the years and this thanks to the awareness of population for this phenomenon.

Such abuse is even a health issue which causes injury but can also lead to fatal consequences, death. Data from General Directorate of Police show that during 2016 were recorded 16 deaths as a result of domestic violence, about 4 cases less than in the previous year.

Regarding suspected persons for violence during 2016 this number is 3,845 suspected persons, or expressed in absolute terms, about 311 more suspected persons compared to 2015.

The number of suspected persons has increased during the period 2012-2016, due to the increased number of reported cases.

Figure 6 presents the percentage of women that report domestic violence in the Police. From figure is seen that this percentage has increased during this period. The highest percentage of the reports is seen in 2014, about 21.6 % women that reports domestic violence.

Table 4: Domestic violence, 2012-2016

Prisoners

Data about prisoners include juveniles, adults and foreigners who are punished by final decision in all the types of prison institutions; the data includes information about the detainees as well. "The detainee" includes any person, citizen, and foreigner or stateless, to whom is taken a security measure "detention in prison, while "Convicted" means any person, citizen, and foreigner or stateless sentenced to imprisonment by a final decision of the Albanian courts.

In 2016 there are 5,946 prisoners. If we compare this number with 2012 there is an increase by 28.8%, where the number of prisoners was 4,618.

Figure 7 show the number of convicted, detained persons and prisoner rate of all offences expressed per 10 thousand inhabitants. The rate of prisoners per 10 thousand inhabitants during 2012-2015 has an increasing trend, while in 2016 is seen a decrease of it. In 2016 this rate marked 20,7 prisoners per 10 thousand inhabitants, while the year 2012 marks 15,9 prisoners per 10 thousand inhabitants.

Figure 8 shows the percentage of detained persons held in prison. In 2016 are about 47.8 % detained persons in prison. So from 5,946 prisoners in total, 2,842 are detainees. This rate has increased from 2012-2015, while in 2016 is seen a decrease of it.

Convicted persons

The convicted persons includes persons who by their actions or behaviors have violated or damaged legal goods protected by law. For these persons are applying criminal sanctions consisting in obtaining or restriction of certain rights that they enjoyed until the commission of the offence, sanctions that consist in prison sentences or alternative sanctions. Alternative sanctions may be half-freedom, work in the public interest, suspension and staying at home.

Table 6 presents the convicted persons by sex and 2 main age-groups. In 2016 are recorded 14,800 convicts, 96.2 % of them are adults and 3.8 % are juveniles. In comparison to 2012 are 54.8 % more convicted or expressed in absolute terms are convicted 5,238 more.

Figure 9 presents the percentage of juvenile convicted for years 2012-2016. From the figure is seen that this percentage has decreased, year by year the number of juveniles (under 18 years old) has fallen.

Data Sources

INSTAT publishes data related to crimes and juridical statistics in the country. Crime-related statistics cover a specific group of penal offences related to recorded crime, perpetrators and damaged persons. The database contains even data about the prisoners and convicted persons. The data source for these statistics in order to present the various indicators is the administrative data. For the compilation of statistics of crimes and the justice system is applying an adequate methodology which refers to the operation of the scheme of information system applying the structures of Police, Ministry of Interior, Courts and the Ministry of Justice. Prisoners-related data are provided by the General Directorate of Prisons, while information about the situation of criminality in the country (perpetrators, victims), are provided by the General Directorate of State Police. Both sources are very important for the progress of work and meeting of the defined time limits.

Damaged persons rate: Number of persons who have been injured by the offences during a 12-month period expressed per 10 thousand inhabitants.

Prisoner's rate: Number of prisoners (sentenced to jail + detainees) over a period of 1 expressed per 10 thousand inhabitants.

SOCIAL PROTECTION

Introduction

This section analyzes the statistics on social protection in Albania for 2012-2016. Social protection includes all interventions made by public and private institutions which have the aim to facilitate the burden of families and individuals for a variety of needs and specific functions. It covers the financial support and services that ensure individuals / families in need or those that are endangered of being poor.

In this section, will find information on contributors to the social security scheme; the number of pension beneficiaries by sex; the number of families and the social assistance fund by family structure; kind of assistance and administrative division; data on unemployment benefits.

Gjetjet kryesore

Social and health insurance

Expenditures for social insurance are component with the largest share of expenditures on social protection.

Expenditure on social security in relation to nominal Gross Domestic Product has been increasing over the period 2012-2016 (Table 1). In 2012, social insurance expenditures constitutes 6.7 % of nominal GDP and gradually increase up to 7.6 % of nominal Gross Domestic Product in 2016.

Expenditures for health insurance are on average 2.3 % of Gross Domestic Product, while expenditures for families in need with social assistance are on average as 1.3 % of nominal Gross Domestic Product (Table 1).

The dependency rate of the social security system, which expresses the number of contributors for one beneficiary, during 2012-2013 (Figure 1) goes to a slight decrease. The increase, of the number of contributors in 2014 and 2015 (Table 2) brings a significant improvement in this indicator, which from 0.98 contributors per beneficiary at the end of 2013 runs at 1.2 contributors per beneficiary at the end of 2015. During 2016, the increase in the number of pensioners was greater than the increase in the number of contributors, which also led to a slight decrease in the rate of dependency.

Fig. 1 System dependence rate
(Raport Contributors-Beneficiaries)

Law no. 153/2014 "For the remission of late payment interests and penalties for compulsory social security contributions payed from self-employed persons in agriculture", gave effect to increase the number of rural participants in 2014. During 2016 compared with previous years, the number of rural contributors was decreased thus the raport of rural contributors per rural beneficiary was decreased (Table 2).

Over the years 2012-2016 the structure of urban and rural pensions by kind of pension is almost the same. On average, 77 % of urban pension are old age pensions; 13.1 % are disability pensions; and 9.9 % are family pensions (Table 2.3.3). On average 89,4 % of the rural pensions are retirement pension, disability pensions are 5,4 % and 5.3 % are family pensions (Table 4).

Social Assistance and unemployment benefit

Social Assistance is one of the main schemes that aims to reduce poverty. In 2016, according to the data of Ministry of Finance for fiscal indicators according to consolidated budget, expenditures for social assistance scheme represent 1.4 % of nominal Gross Domestic Product (Table 1). During 2012-2016, the share of expenditure on social assistance to nominal Gross Domestic Product has varied from 1.35 % in 2012 to 1.33 % in 2016.

The number of families receiving social assistance varies by family composition (Table 6) and kind of assistance that family benefits (Table 7). During 2016, families with four members have the largest share in families receiving social assistance (30,3 %), followed by families with five members (22,4 %). During the period 2012-2016, number of families on full social assistance has increased from 32.7 % of households that are part of the scheme in 2012 to 49.4 % of households that are part of the scheme in 2016.

In 2013-2016, the average number of families receiving social assistance has decreased from 104,398 in 80,147 families. Compared to 2015, during 2016 the number of households receiving social assistance increased by 0.1%.

During 2016 compared with previous years, the monthly unemployment benefit increased to 11,000 ALL from 6,850 ALL (Table 8). The monthly unemployment rate is determined by a decision of the Council of Ministers and is the same for all beneficiaries. The annual average number of registered unemployed jobseekers receiving unemployment benefit for 2012-2016 has decreased from 9,772 to 5,141.

Source of Information

The social protection system in Albania consist of: (1) Social Insurance System; (2) Health Insurance System; (3) Social assistance and social services; and (4) Employment services.

Data on social protection expenditure in relation to nominal GDP are published periodically on reports of fiscal indicators of the consolidated budget on the official web of the Ministry of Finance: [http://www.financa.gov.al/files/userfiles/Programimi_EkonomikoFiskal/Raporte_dhe_Statistika_Fiskale_Mujore/Statistika_Fiskale_Mujore/2016/12_mujore_perfundimtare/Treguesit_analitik_fiskal_-_DHJETOR_2016_\(27_prill\)_perfundimtare.xls](http://www.financa.gov.al/files/userfiles/Programimi_EkonomikoFiskal/Raporte_dhe_Statistika_Fiskale_Mujore/Statistika_Fiskale_Mujore/2016/12_mujore_perfundimtare/Treguesit_analitik_fiskal_-_DHJETOR_2016_(27_prill)_perfundimtare.xls)

Social Insurance Institute is the source of data on contributors to the social insurance scheme, the number of pension beneficiaries by sex. Social Insurance system based on the contributory principle, the principle of self-responsibility of the individual for future risks in the social

field as well as on the principle of agreement generations "pay today to benefit tomorrow". State Social Service is the source of information for data on social assistance. National Employment Service is the source of information for data on unemployment benefit. The program of unemployment benefit is part of national employment policies, which provide income for the unemployed persons at the time of their start period of unemployment, aiming to create conditions for their return to the labor market.

Definitions

The average number of contributors represents the persons that have deposited the contribution of social insurance during the reference period. The state pays contribution for soldiers, unemployed receiving unemployment benefit, persons in transition payment from the supplementary state insurance and military officers in reform that take the supplementary insurance for military officers. The average number of contributors is calculated each month based in payment lists that the subjects are obliged to submit near the social insurance agencies.

Old-age pension is that pension benefit by insured persons in the form of monthly payment for men over 65 years old and for women over 60.4 years old so after they have completed 35 years of insurance. Mothers who have given birth to 6 or more children who are over 8 years old are entitled to retire when they reach 56.6 years old and have 30 years of insurance. Old age pensions can also be reduced or partial.

Pension disability pension benefit by persons who become disabled for any economic activity and severe deformity and physical injury (including blindness).

Family pension is pension benefit by remaining members of the family with a dead person (spouse, children).

The system dependency ratio is the ratio contributors-beneficiaries.

Social assistance is a cash assistance to poor families and distributed every month. It can be full or partial depending on family income. The amount of partial social assistance is calculated as the difference between the full amount of social assistance and real family income. All Albanian families in the city and countryside who lack the income and livelihoods totally or have them insufficient, benefit social assistance.

Unemployment benefits is cash assistance given for a period of 12 months to unemployed persons who have contributed to social insurance scheme for less than 12 months.

HEALTH

Introduction

The purpose of this chapter is to give an overview of the health status of the population in Albania. It looks at current population health statistics, which are expected to have a long and healthy life, to be protected against many diseases and accidents, and to receive proper health care. In this section we will look at statistics for health institutions. It also presents statistics on health care, with an analysis of the number of hospital beds, this publication also briefly describes the sources of health care, access and use of healthcare and the costs involved in the Albanian health sector. Health care systems are organized and funded differently, but the main goal is to provide a universal healthcare service that will serve a better health care at an affordable cost for both parties (individuals and society in general), is a basic need.

The main findings

In 2016, the largest part of the group of diseases that caused deaths was that of the "Diseases of the bloodstream", with 51.7%, followed by the group of diseases "Tumors", with 15.8% in 2016. It is noted that the number of causes of deaths in the group of "Unknown" diseases has decreased in 2016, from 1.9% to 4.4%. This improvement in the assessment of the causes of death has come as a result of improvements in the diagnosis of causes of death by doctors.

Fig. 1 Causes according to disease groups of deaths year 2015-2016

Source of Information: State Social Service

The age group 50 years and over occupies over 90% of the deaths recorded in 2016, with a death toll of 19,775. The age group 85 years and older accounts for 25% of deaths

recorded in 2016, with 5,345 deaths. The highest number of deaths in the age group 85 years and older are women, which account for 63.8% of the total age group.

Fig. 2 Deaths 50 years and over by age group

Primary health care service

The primary healthcare provider in Albania is the Ministry of Health. It offers this care in three levels. The primary health care service is the first rate where citizens present their problems and where the basic service is provided to the Albanian population. Primary care institutions have the mission of providing a living in the best possible conditions in accordance with the objectives of the Albanian Government. During these years, basic public institutions have been consolidated, providing these services, creating the most appropriate facilities, enhancing the quality of services and encouraging the private sector in this area. It includes polyclinics, health centers, ambulances and special services for children’s and women’s consultants.

According to Table 1, we receive information on primary healthcare infrastructure in years (including ambulances, primary health care centers, and the number of outpatient clinics). Data focus is mainly on public services on the basis of administrative records, because the private sector is in the first steps of consolidating it. As the number of health centers, ambulances and polyclinics has come to consolidate over the years, the average number is 4.9 outpatient clinics for a health center in 2016, so in Albania there are 414 health centers and 2,062 ambulances (2016). There is also an increase in the number of visits in total, comparing them over the years, mainly focusing on the age group under 14 and over 60 years old.

Tab. 1 Activity of health centres, ambulances and polyclinics for 2012 -2016

Description	Year				
	2012	2013	2014	2015	2016
Total visits	6,959,396	6,283,230	7,825,455	7,746,290	8,120,123
A Health Centers	421	409	427	408	414
Number of visits in Health Centers	3,020,952	3,191,803	3,230,202	3,239,783	3,141,755

Source: Ministry of Health

Ages requiring medical care are mainly those under the age of 14 and those over the age of 60, approximately 50% for 2016. The total number of visits increased in 2016, compared to 2015, by 4.8%. a change of visit tendencies by sitting at the Health Centers, respectively by -3%, passing their visits to the polyclinics with a 5% increase, and in a broader

form at the local Ambulances, with an increase by 22% compared to 2015. Compared to 2012 there is a stable trust of family members for health centers, but over the years it has been noted that the perception of family members for ambulances, especially Polyclinics has been increasing.

Fig. 3 Number of visits on Health center, Ambulances and Polyclinics

Within the primary healthcare service there are specific services for the care of the mother and the child, who provide services to this group of people. According to the Ministry of Health, the activities of the women's consultant for the years 2012-2016 (table below).

This consulting service is followed by the obstetrician physician and almost the number of first obstetric visits is approximately the same as the number of births reported in our country, during 2016 of these 65 % are visits conducted during 0-13 weeks and 10,9 % are visits over 28 weeks, this distribution has remained unchanged in these years.

Tab. 2 Activity of women's consultation for 2012-2016

Items	Years

The activity of the child consultant in this evidence is focused on child follow-ups of 0-12 months and how they are fed according to WHO recommendations. The following data shows that the number of children attending the high medical staff for 2016 is 52%.

From the data reported by the Ministry of Health it is noticed that there is a decrease in the number of breastfeeding children and the increase in the number of babies that are fed with artificial milk since year 2016 compared to 2015 this figure has increased by 12%.

Tab. 3 Activity of child consultations for 2012-2016

Hospital care service

With regard to the public health hospital infrastructure, the number of hospital beds shows the availability of health care and coverage from this service of the population. Hospital service is provided by regional hospitals with basic and specialized services. Secondary medical services in our country are provided by 42 public hospitals with 8.172beds counted in 2016.

The number of hospitals and hospital beds is almost the same in recent years in Albania, also this number is

low when compared with the countries of the region and we have 30 beds / 10,000 inhabitants for 2016. From the viewpoint of distribution of hospitals they are mainly concentrated in Tirana, continuing with Elbasan, Korça, Vlora, Berat, etc. Also, as mentioned above, we have only information from the public sector, based on administrative records, the private hospital service has grown considerably and today, 11 private hospitals are counted in Albania.

Tab. 4 Activity of institutions with beds 2012 – 2016

Activity indicators	Years				
	2012	2013	2014	2015	2016
Number of hospital institutions	44	44	42	42	42
Hospitalized persons	8,410	8,283	8,295	8,224	8,172
Hospitalized persons	247,220	260,727	257,047	276,901	275,165

Source: Ministry of Health

Also, table data shows that in Albania the use of hospital beds continues to be below 50%, while in terms of average residence time it has been almost the same in years and in 2016 the average days of a patient's stay hospital are 5.3 days a year.

The child vaccination service in Albania is a well-established service, thanks to the care and policy of the government from year to year the child consultant achieves coverage of almost 100% of all vaccination cases.

Tab. 5 Vaccination indicators for the children, 2012- 2016

Part of the hospital care is the obstetric gynecological service, where special care is given to the pregnant woman and to the newborn baby.

The number of births in Albania since year has declined, this is related to the social conditions of families that have undergone structural changes, and is also related to the considerable outflow of the population abroad. As seen in the table below, year by year at the same time with the reduction of births we have a decrease in the number of abortions, in 2016 compared to 2012 there is a decrease of

31% of the number of abortions. The birth-abortion ratio has changed from 4.5 births to 1 abortion in 2012 to 5.9 with 1 abortion that is, one abortion for every 6 births in 2016. Proportion of abortion (abortion to 1,000 live births) at country level has come down for 2016 and is 170 for 1,000 live births.

Regarding the structure of abortion, there are changes in years where spontaneous abortions account for 77% in 2016 and those with medically interrupted 23% of the total this year.

Tab. 6 Births and abortion in Albania 2012-2016

Items	Years				
	2012	2013	2014	2015	2016
Pregnancies	43,319	42,388	41,652	38,595	37,129

The following graphs show that the number of abortions is related to age, place of residence and the status of women's employment.

Fig. 4 Number of abortions by years

Fig. 5 Percentage of abortion by ages

Fig. 6 Percentage of abortions according to women's employment

Expenses on healthcare

Healthcare expenses include public spending (government) and private spending. We are currently focusing on indicators in the public sector, where they cover preventive, curative health services, mother and child health activities, emergency health benefits, etc.

Public expenditures in the sector for 2016 were ALL 41.802 billion. This accounts for 9.68% of total public spending for 2016 and has a share of 2.82% of total GDP. Public health spending has increased by 8.36% compared to 2016. Public expenditure values show an increase in health impact both in total public spending and in total of GDP in 2016.

Tab. 7 Shpenzimet Buxhetore në shëndetësi

Data are provisional

Fig. 7 Budget expenditures on healthcare

Source: Ministry of Finance
Data are provisional

Source of data

INSTAT is one of the leading institutions in the country that publishes data on health and health indicators. The source of data is generally the administrative data as well as the specific observations that have been performed and carried out by the institution over the years. Administrative statistics are provided by health institutions where the primary source of these data is the national patient records or annual reports from the institution's basic register, which are reported in formats defined by the Ministry of Health. The selection and setting of methodological criteria is based on concepts, definitions, and comparable international methods. In this publication, data sources for different indicators are the administrative ones taken based on statistical evidence from the Ministry of Health, etc. This chapter mainly reflects information on the activity of preventive, curative, healthcare and medical staff graduates.

Definitions

Morbidity

Disease is the proportion of cases of diseases in a defined population. It is measured by the prevalence or incidence of the disease. The spread of a disease can have serious impacts on other aspects of the population. Data on the frequency and distribution of an illness can help control its spread and in some cases may lead to the identification of its cause.

Prevalence Co-author

The prevalence coefficient is the number of persons who have a particular disease at a given point in time for 1,000 at risk. This coefficient includes all cases of the specified period. Prevalence coefficient is an instant "picture" of an existing health situation: it describes the health status of a population.

Incidence coefficient

This coefficient shows the number of reported cases of a specific disease per 100,000 inhabitants during a given year. Incidence coefficient is a particular type of prevalence coefficient but differs from that to what is based on the number of new reported cases, which is not necessarily the number of people affected by the disease (some people may experience the disease more than once).

Hospital illnesses

The total number of patients hospitalized in all hospitals during a given calendar year with the major diagnosis that is part of the ICD9 / ICD10 classified disease category..

Exit from the hospital

It is the end of a period when the patient is treated hospitalized and then returned to his home or transferred to another rehabilitation facility (transfer to another ward of the same hospital is not considered as outpatient) or when he dies.

Number of Hospitals

The hospital is an institutional residence equipped to provide 24-hour medical and 24-hour hospitality, diagnosis, treatment and rehabilitation for the sick and injured who may need medical and surgical assistance: equipped with professionally trained staff and with at least one physician. The hospital may not necessarily also provide the service and outpatients. The number of hospitals includes: general, specialized hospitals, emergency rooms and hospitals for a long time.

Total number of hospital beds

The hospital bed is routinely maintained and used for long-term accommodation and care of a number of patients and is located in a pavilion or hospital space where medical care is continually provided. This should include the beds of all the hospitals. This number should be measured when available in beds available during a given calendar year; qq. is not possible then measured as beds available between a given year (preferably) or count at the end of the year, which depends on the national practices used. From this indicator are excluded: neon beds, day beds, spare and temporary beds, beds in the storeroom, beds for special purposes or belonging to the equipment for certain purposes such as dialysis equipment, transport beds.

Average duration of stay in all hospitals

It is the ratio of the total number of hospital beds to hospital with the total number of hospital admissions or exits. The length of stay of a patient in a hospital is equal to the date of exit minus the date of admission. If the date is the same, then the day of hospital stay is one day.

Number of Primary Health Care Centers

includes all health care providers that provide health care for outpatient patients: hospitals, polyclinics, ambulances, medical centers, emergency assistance etc, which are equipped with at least one medical qualified person (doctors or nurses).

Number of Abortions is the number of all abortions regardless of the methods used.

Abortion is the termination (loss) of pregnancy before the fetus is developed

EDUCATION

Introduction

Education plays a very important role in creating human capital and is one of the preconditions for a country's economic and social development. In Albania, the right to education is guaranteed by the Constitution, for all citizens without any distinction. The documents through which education policies are expressed, are Development Strategies for Higher and Pre-University Education, as well as relevant laws. While, are statistics that reflect on data and indicators, the educational activity carried out in the country. The information in this publication, includes statistics on formal education that is carried out at all levels of the education, which consists of pre-university education and higher education.

Pre-university education includes pre-school education, primary and secondary education. Basic education by 9 year of schooling, it is compulsory, starts at age 6 and lasts 9 years. The student is required to attend basic education up to the age of 16. Basic education consists of two cycles: primary education that is conducted in grades 1 - 5 and lower secondary education, conducted in grades 6-9. Upper secondary education includes: general education which performed in gymnasium, professional education and socio-cultural. The education service in the country, is provided by both public and non-public educational institutions. INSTAT uses in data processing and calculation of education indicators, the international standard classification

of education, ISCED 2011. This new version which is recommended previously by Eurostat and UNESCO, replaced the previous of 1997 version, at the same time and from all countries. For the first time, the new classification is implemented internationally, for data of the school year / academic 2012-2013.

The main findings

The main indicators that measure participation of pupil and student in education, are the gross and net enrollments rate. These reports are considered particularly important in compulsory education, and especially in primary education. If the GER indicator is above 100.0%, it means participating in a certain level of education, pupils or students of a lower or greater age than those belonging to the population, that according to the law, should participate at that level of education. For example, if the GER in primary is 104.0%, it means that not only children aged 6-10 years old, but also 5 or older than 10 year olds, participate in that level. But if it is below than 100, it means that not all children of the official age group, have attended education for the given year. Net enrollment ratio - NER is always smaller than GER. This is because NER compares pupil of a certain age group enrolled of an educational level, with the population of that age group, that officially belongs to that level. For example, NER for primary education compares 6-10 year old enrolled in primary education with 6-10 year old population.

Fig. 1 Gross and Net enrollment ratio in primary and lower secondary

In 2016-2017, 83.6% of the population of the age group 3-22 years attended education at all levels of education

Fig. 2 Participation in education by levels GER, NER, year 2016-2017

Pre-school education is provided in kindergartens and preparatory classes, attended by children aged 3 to 5 years. The share of children in kindergartens is on a steady growth and in 2016 it reached 81.5% compared to the population by age group.

Pupils of pre-university education have a continuous decrease in absolute value.

Even though the number of pupils in secondary education is down by 17.7 percentage points in 2016-17 compared to 2012-13, the number of students in professional education is increased by 4.1 percentage points.

The structure of pupils in upper secondary education has changed over the years as figure below.

Fig. 3 Pupils in Upper secondary Gymnasium and Professional

Also, graduates of vocational education in 2016 have grown 1.6 times compared to 2012. In Tertiary, 59.2% of total graduates in 2016, belongs to

those of Bachelor programs. The remaining 40.8% consists mainly of those who graduates mainly in Master programs and a small percentage in PhD.

Fig. 4 Graduates in Tertiary

The greatest number of graduates by broader fields of study in tertiary, over the last four years, belongs that of social sciences, business and law field. The second place occupies the field of health and wellbeing, although the number of graduates in this field is as much as 1/3 of those in the social

field in 2013, up to 2/5 in 2015 and 2016. Natural sciences and engineering hold still very high values among the graduates, but still have a 1.2 percentage point increase compared to 2012 and 2016.

Fig. 5 Graduates by field of study

An important indicator in education is the indicator of the number of pupils or students per 1000 inhabitants. These reports are declining for several reasons. One main

reason is that Albanian pupils and students have preferred to study abroad. But also one more reason aging population of the country.

Fig. 6 Number of pupils and students per 1000 inhabitants

Public spending on education are almost stable over the years.

Methodology

The ISCED-2011 classification used in education statistics is composed of the following levels according to educational programs:

- Level 0 - Early childhood education - Early childhood / Pre-primary education
- Level 1 - Primary education or first cycle of basic education
- Level 2 - Lower Secondary Education or second cycle of basic education
- Level 3 - Upper Secondary Education - Gymnasium / Professional
- Level 4 - Post-secondary but not high education
- Level 5 - Higher Education Short Circuit
- Level 6 - Bachelor or equivalent
- Level 7 - Master or equivalent
- Level 8 - Doctorate or equivalent

Level 5 has not been applied to our education system.

Definitions

Pre-university education includes education provided by educational institutions such as kindergartens, basic schools and upper secondary ones.

Basic education consists of two cycles: primary education that is conducted in grades 1-5 and upper cycle or lower secondary education that is conducted in grades 6-9. Basic education is compulsory at age 6 and lasts 9 years. The student is required to attend basic education up to the age of 16 years old.

Upper secondary education includes gymnasium and professional education, which is divided into lower technical(vocational) and higher professional education.

The tables in the publication refer to gymnasium and higher professional education, which is also its main part.

Teachers are defined as persons, whose professional activity involves the transmission of knowledge, behaviors and skills, that are defined in the educational programmes, for pupils and students enrolled in institutions of formal education.

A public educational institution is classified as such if its activity is fully controlled by the public education authority.

Graduated in an educational program, is a pupil or student, who has successfully completed all program requirements.

Gross Enrollment rate is number of students enrolled in a given level of education, regardless of age, expressed as a percentage of the official school-age population corresponding to the same level of education.

Net enrolment rate is total number of students in the theoretical age group for a given level of education enrolled in that level, expressed as a percentage of the total population in that age group.

Pupil per Teacher Ratio, are calculated by dividing the number of pupils enrolled at the specified level of education by the number of teachers at the same level.

Data source

Tables, figures and comments that have been elaborated for this chapter, have as main source the administrative data INSTAT receives from the Ministry of Education, Youth and Sports, Ministry of Finance, etc.

LABOUR MARKET

Introduction

Statistics on employment can be used for various analyses, including those macro-economic ones that look at employment as a production factor. At micro level, those may be used also for studying a number of social aspects related to the situation of employment of an individual, as it is: employment as a source of household income, social integration of immigrants, etc. Being a structural and short term indicator, it reflects the structure of labour markets or economic systems and follows the business cycle too.

The unemployment rate, on the other side, defined according to standards set by the International Labour Office (ILO) is one of the most important indicators widely used for international comparison. That is an important social and economic indicator. The unemployment rate of a country do not only express the percentage of the labour force not in employment, but also the unused labour potential of a country. Moreover, changes in the unemployment rate may be first signs of an economic improvement or crisis in a country.

Employment statistics are the bases of many policies of a country, for which strategies are designed, national objectives are set and action plans are built aiming their implementation. These statistics serve not only for designing employment strategies but also for education strategies (as improvements in vocational education, focus on branches where demand for employment are higher or providing facilities for long-life learning), increasing of employment possibilities for young people, improvements in the direction of availability of child care institutions increasing in this manner the possibilities for participation in employment, etc. Measuring and following trends of employment and unemployment indicators serve not only to analyses of actual situation, but also to monitor strategies and taking measures in due time in order to prevent economic fall or for further promoting improvements in economy.

EMPLOYMENT

Labour market statistics are the bases for designing many social and economic policies. The employment rate, in other words, the proportion of the working age population in employment, is a key social indicator.

This subchapter provides information on recent employment statistics in Albania, including an analysis based on important socio-economic dimensions: employment statistics show significant differences by sex, age, education attainment, etc.

Main statistical findings

Based on the Labour Force Survey (LFS), the employment rate for persons aged 15 to 64 years old, after a decrease from 55.9 % in 2012 to 49.9 % in 2013, had an increasing trend during the period 2014-2016, reaching at the end of this period again the value of 2012 with 55.9 % (Table 2).

Employment rates are generally lower among women and among younger workers. This characteristic is noted in the Albanian labour market too.

During all the period 2012-2016, the female 15-64 years old employment rate has been lower than males. The difference among the two values of employment rates during the period we are analyzing has been lower in 2016 with 12.2 percentage points (61.9 % for males and 49.7 % for females 15-64 years old) and higher in 2015 with 15 percentage points (60.5 % for males and 45.5 % for females 15-64 years old).

Fig. 1 Employment rate by sex

Source of information: Labour Force Survey, 2012-2016

Analyses by age tell that employment rates are lower for young age-groups (15-29 years old) compared to older ones (30-64 years old). In 2016 the employment rate for young people at the age 15-29 years old was 32.4 %, whereas for those 30-64 years old was 67.2 %. Regarding the trend of the youth employment rate during the period we are analysing, the highest value is noted in 2012 with 34.5 %; afterwards a decrease of this indicator is noted reaching the value 28.2 % in 2013-2014 and an increase in 2015-2016 respectively with values 29.8 % and 32.4 %. Analyses of the youth (15-29 years old) employment rate by sex, tell that it follows the trend of the 15-64 respective indicator, so being higher for men then for women. The difference between these two

indicators has been lowest in 2012 with 9.3 percentage points and highest in 2015 with 12.6 percentage points.

Employment rates vary considerably according to highest level of education attained. For the population 15-64 years old, the employment rate is higher for persons with tertiary education and persons with vocational upper secondary education and this is noted during all the period 2012-2016. In 2016 this indicator was 66.6 % for employed with tertiary education, 64.5 % for those with vocational upper secondary education, 52.5 % for those with up to 8/9 years school and 52.3 % for persons with general upper secondary education (Table 3).

Fig. 2 Employment rate by education attainment

Source of information: Labour Force Survey, 2012-2016

The highest proportion in the employment of the population 15 years old and over, is of persons employed in agriculture with 40.2 % and those in services with 40.4 %, whereas industry employs only 19.3 % of the total employment in 2016. Analysed by sex, in 2016 almost half of employed females 15 years old and over are employed in agriculture (45.4 %), whereas among 15 years old employed males, in agriculture work 36.2 % of them.

Employees constitute 41.2 % of employed 15 years old and over in 2016, self employed 34.9 % and unpaid family workers 23.9 %. Regarding differences by sex, to be mentioned is the fact that in 2016, among employed males at the age 15 years old and over, 42.0 % of them are self employed, whereas the respective indicator for females is 25.7 %. The opposite is noted among unpaid family workers where for the same year, their share among employed females 15 years old and over is 31.2 % whereas for males this percentage is only 18.2%.

Fig. 3 Distribution of employment by economic activity

Source of information: Labour Force Survey, 2012-2016

Among employed females 15 years old and over, the percentage of those working in industry is 14.7 %, whereas the respective indicator for males is 22.9 %. Services do not show big differences in employing females and males (Table 4).

So, while no significant differences in employment as employees are noted between males and females, females are mostly found as unpaid family workers and males as self employed (Table 5).

Fig. 4 Distribution of employed by sex and status in employment

Source of information: Labour Force Survey, 2012-2016

Regarding employment by occupation groups, 50.7 % of employed 15 years old and over work as “Skilled agricultural and trades workers” in 2016, followed by occupation groups of “Clerical, service and sales workers” and “Managers, professionals, and technicians” with respectively 17.8 % and 17.7 % in 2016. Employed in groups “Plant and machine operators, and assemblers” and “Elementary occupations” have a lower share with respectively 7.4 % and 6.1 % of employed 15 years old and over in 2016 (Table 6).

Regarding type of contract of employees, 10.9 % of employees (15-64 years old) had a job with a contract of limited duration in 2012. This proportion had an increasing trend till 2014 with 13.7 %. In 2015 and 2016, this proportion was at the values 11.8 % and 12.5 % (Figure 5).

Fig. 5 Percentage of employees with contract of limited duration

Source of information: Labour Force Survey, 2012-2016

Data sources

The data source for all of the information presented in this subchapter is the household Labour Force Survey. For the period 2012-2016, the Labour Force Survey is a continuous survey (spread over all weeks of the calendar year), and results presented in this publication are calculated as yearly average.

The Survey was conducted for the first time in 2007 and afterwards with yearly periodicity till 2011. Since 2012 the Survey is continuous with quarterly results. It provides annual and quarterly information on the participation in the labour market of persons of age 15 years old and over. It collects information on labour force (persons in employment and unemployment), characteristics of employment, working time, educational attainment, demographic characteristics and household composition. The survey applies employment definitions in full harmonisation with the International Labour Office (ILO) and Eurostat.

Quarterly and yearly indicators calculated based on data of the Labour Force Survey, are published from INSTAT by sex, age-groups, educational attainment, etc.

The sample is based in a two-stage sampling procedure where in the first stage are selected the geographical areas with a proportional probability to the size of the enumeration area. In the second stage within each geographical areas (once selected in the first stage) are selected a fixed number of households by equal probability systematic sampling method. For the LFS is used a rotational sampling design, whereby a household once selected for interview,

is retained in the sample for a total of five consecutive quarters. According to the rotational sampling design, each quarter one fifth of the selected households are new and 80 per cent of them are in common. Data collection in the fieldwork is spread during all months of the year. The gathered data refers to a specific reference period named reference week. The reference week is the calendar week which starts on Monday and finishes on Sunday before the interview date.

Definitions

Employed are persons aged 15 and over who during the reference week performed work - even if just for one hour a week - for pay, profit or family gain. Employed are considered also persons not at work during the reference week, but who had a job or business from which they were temporarily absent due to illness, holidays, education and training, industrial dispute, maternity leave, bad weather etc.

(Persons who work on their small farm, who do not sell their products, but produce only for self-consumption, are considered employed).

Working age population is the population 15-64 years old.

The employment rate is the proportion of employed 15-64 years to the working age population.

UNEMPLOYMENT

Labour market statistics are of great importance in designing labour policies. A very important indicator is the unemployment rate, which represents the part of unemployed in the total labour force.

This subchapter provides an overview related to the actual unemployment statistics in Albania, which given in a five year period of time, show a dynamic view of the situation of the unemployed persons in the labour market.

Main statistical findings

Unemployment trends

In the five-year period 2012-2016, unemployment statistics in Albania, give a dynamic picture of the unemployment situation in the labor market. In 2012, was recorded the lowest rate of unemployment with 13.8 % for the age group of the population 15-64 years. After 2012, the unemployment rate has a growing trend marking the highest value in 2014, with 17.9 %. While in 2016 there is a decrease of this indicator by 1.9 percentage points compared to 2015, marking the value of 15.6 % (Table 1).

With regard to the unemployed with tertiary attainment, the unemployment rate in 2016 decreased by 2.1 percentage points compared to 2015. This decrease in the unemployment rate is more vulnerable to women, by 4 percentage points than in the previous year 2015.

If we refer to the duration of unemployment, the unemployed for one year or more, called the long-term unemployed, occupy most of the total unemployed (66.6 % of the unemployed 15-64 years in 2016) (Table 3).

In the economically inactive population (persons not classified as unemployed or employed) of the age group 15-64 years old, the percentage of discouraged persons is the highest in 2013 (16.1 %). This indicator in 2016 compared to 2012 decreased by 0.9 percentage points, respectively from 11.6 % to 10.7 % (Table 4).

Male and female unemployment trends

The unemployment rate has different tendencies by gender. In Albania, during the period (2012-2016), for the population aged 15 years and over we have lower female unemployment rates than for males. This difference in 2016

Fig. 1 Unemployment rate by age-groups

Source of information: Labour Force Survey, 2012-2016

The unemployment rate varies according to the level of education. In 2012-2016, the unemployment rate for the 15-64 age group continues to be higher for people with general secondary education. It marks 18.9 % in 2016 for this category. For the same population, it is noted that there is a considerable difference between the unemployment rate for persons with general secondary education and those with secondary vocational education throughout the whole period 2012-2016. This difference in 2016 is 4.0 percentage points more for unemployed people with general secondary education compared to those with secondary vocational education (Table 2).

is 1.5 percentage points (15.9 % for males and 14.4 % for females). In 2015 the unemployment rate for both males and females was at the same level, with 17.1 % (Table 1).

In 2016, compared to 2015, the unemployment rate for males aged 15-64 decreased by 1.1 percentage points, while for females of this age the unemployment rate decreased by 2.8 percentage points. It is noticed that during the period (2012-2016) for both males and females aged 15-64, the unemployment rate is higher for the general education category than for those with vocational and higher education.

In persons with higher education, males aged 15-64 years old have lower rates of unemployment than females. The biggest difference is noted in 2012, where the unemployment rate for females was 7 percentage points higher than for males of this category. In 2016, the unemployment rate for males with higher education is 16.5 %, while for females is 17.6 % (Table 2).

In 2016, for females with higher education, the unemployment rate decreased by 4 percentage points compared to 2015 and for those with vocational education this indicator decreased by 3.3 percentage points.

Regarding long-term unemployment, from 2012 to 2016 for the population of the age group 15-64, the share of long-term unemployed males among unemployed males is lower than the respective share of females (respectively 65.3 % and 68.4 %) (Table 3).

Among economically inactive males 15-64 year old in 2012-2016, the percentage of discouraged unemployed is greater than the equivalent percentage of females (14.9 % for males and 8.1 % for females). The difference is greater for the age group 30-64 years old in favor of males (Table 4).

Youth unemployment trends

Young people are generally characterized by a higher unemployment rate compared to other age groups. According to the Labor Force Survey, in 2012, the unemployment rate for young people aged 15-29 was 26.0 %. The unemployment rate for this age group has increased till 2015 with 33.2% and then falls in 2016 to 28.9 %. In 2016, the unemployment rate for young people aged 15-29 years continues to be almost twice as high as the unemployment rate for the population aged 15 and over (Table 1).

In the population aged 15-29, a special group is identified, including young people who are neither employed nor attending education or training. Throughout 2012-2016, on average three out of ten young people aged 15-29 are part of this group. In 2016 young people who do not work and are not in education or training constitute 30 percent of young people.

It is noted that the proportion of females not in employment, education or training among females of this age is higher

Fig. 4 Share of discouraged workers by age-group

Source of information: Labour Force Survey, 2012-2016

From 2012 to 2016, young males aged 15-29 have higher unemployment rates than females of the same age group, whereas in 2015 this indicator is 2.4 percentage points higher for females than for males of the same age group (Table 1).

Among the economically inactive young people (15-29 years old), the percentage of the discouraged category in 2016 is increased by 0.4 percentage points compared to the year 2012. The largest impact in this increase is given by males of this age group with 2,1 percentage points compared to 2012 (Table 4).

than the equivalent percentage for males (respectively 32.9 % and 27.5 %) (Table 5).

Analyzing the group of young people who are not employed or attending a school or training by economic activity status, it turns out that about 60% of them are economically inactive. From a gender perspective, in 2016, 71.6 % of young females who are not employed or attending a school or training are economically inactive in the labor market. While among the males of this group, in 2016, 49.4 % are economically inactive.

Data sources

As for employment indicators, the source of the data used to calculate the unemployment indicators in this subchapter is the household Labor Force Survey conducted according to Eurostat and International Labor Organization recommendations. This survey, conducted continuously since 2012, enables quarterly and annual indicators to be available. Quarterly indicators provide largely general information on gender-disaggregated unemployment and unemployment by age groups. The annual indicators for 2016, calculated as annual averages for 2012-2016, are more detailed by providing information on unemployment by educational level, duration, by categories of unemployed, etc. Unemployment indicators are published by INSTAT in absolute values and percentages.

Definitions

Unemployed comprise persons who were:

1. without work during the reference week, i.e. neither had a job nor were at work (for one hour or more) in paid employment or self-employment;
2. currently available for work (before the end of the two weeks following the reference week);
3. actively seeking work, (had taken specific steps - in the four week period ending with the reference week - to seek paid employment or self-employment) or who found a job to start later (within a period of at most three months).

The following are considered as specific steps:

- Having been in contact with a public employment office to find work;
- Having been in contact with a private employment agency to find work;
- Applying to employers directly;
- Asking friends, relatives, unions, etc., to find work;
- Placing or answering job advertisements;
- Studying job advertisements;
- Taking a recruitment test or examination or being interviewed;
- Looking for land, premises or equipment;
- Applying for permits, licenses or financial resources.

Labour Force includes employed and unemployed persons.

The *unemployment rate* is the ratio of the unemployed to the labour force.

Non-economically active population comprises all persons who are not classified as employed or unemployed (pupils/ students, housekeepers, in compulsory military service, retired, disabled, discouraged unemployed etc.).

Long term unemployed refer to the number of persons unemployed for one year or more.

CONSUMPTION STATISTICS

The consumption expenditures statistics provide descriptions on the level and structure of consumption expenditures of Albanian households and other indicators based on consumption expenditure. The data on consumption expenditure are calculated based on the Household Budget Survey, which is a statistical survey carried out at the Albanian usual resident households and give a clear overview of the socio-economic situation of the Albanian households. The survey results are also used to update the Consumer Price Index and to calculate the Households Final Consumption Expenditure as an important aggregate of the GDP with the consumption expenditure method.

Main Findings

The average monthly consumption expenditures in 2015 are estimated to be 70.766 ALL or on annually basis, 849.192 ALL, taking into account that a household in Albania is composed by 3.8 persons on average.

The structure of the average monthly/annually consumption expenditure gives a clear overview of the household budget distribution. The largest share of the average monthly consumption expenditures goes for food and non-alcoholic beverages, 48.7 percent, a considerable part of which goes to products: meat and its products, bread and cereals, eggs, milk and milk products/derivate. Regarding the expenditures that households dedicate for the dwelling for electricity, water, fuel, paid rent and small repairs, they compose 10.3 percent. The Albanian households dedicate for transport 6.8 percent of their total budget (Table 2.1.1).

The average consumption expenditures by the type of households: The structure of the consumption expenditures by the type of households shows a part of the overview of the socio-economic situation of Albanian households. The level and the structure of consumption expenditures differ depending on the size and the composition of the household which directly affect the distribution of the household budget. Households composed by an adult with children spend more on food compared with the other types of households, 54 percent. While, the highest consumption expenditures for alcoholic beverages and tobacco are recorded in households with three or more adults with or without respectively 3.8 and 3.9 percent. The highest consumption expenditures on clothing and footwear result in households composed by an adult with children, two adults with children and three or more adults with children respectively 5.4, 5.3 and 5.2 percent. The presences of children in households with three or more

adults with children increase the expenditures on transport. The highest expenditures on education are recorded in households composed by an adult with children, 4.1 percent. Regarding the expenditures on health, the highest expenditures are recorded in households with one person, 4 percent. Households composed by an adult with children show the highest consumption expenditures in furnishing, household equipment and routine maintenance of the dwelling compared to the other types of households. Expenditures regarding on restaurants and hotels, are highest in households composed by an adult, 5.5 percent. Households composed by an adult with children show the highest consumption expenditures on recreation and culture, 4.2 percent. The highest consumption expenditures on communication are recorded in households composed by two or more adults without children type, 3.2 percent (Table 2.1.2).

Average monthly consumption expenditures by household size: The analysis of the consumption expenditures structure by household size completes the overview of the socio-economic for each category of its classification. The highest consumption expenditures on food and non-alcoholic beverages result from households composed by one person, 52.6 percent followed by the households composed by seven or more persons, 50.9 percent.

Consumption expenditures on alcoholic beverages and tobacco record the highest value on households composed by one seven or more persons, 4.9 percent. Households composed by person, show the highest consumption expenditures for housing, water, electricity and paid rent, 13.1 percent. The highest consumption expenditures on transport are estimated in households composed by six persons, 8.1 percent.

Households composed by two persons, record the highest value on consumption expenditures for health, 5.2 percent. For the education expenditures, households that dedicate the highest expenditures among other types, are recorded in those with six persons, 3.4 percent. The highest consumption expenditures on furnishing, household equipment and routine maintenance of the dwelling are recorded in households composed by two and four persons compared to with the other types, 5.0 and 4.9 percent. Households with four and six persons show the highest percentage of the total consumption expenditures, for clothing and footwear, 5.7 and 5.5 percent. The highest expenditures on restaurants and hotels are recorded on households composed by one person, 5.5 percent (Table 2.1.3).

Data Sources

The data described in this material refer to the Household Budget Survey 2015. The unit observed is the usual households and their members, households which are usual residents in Albania during the respective year of the data collection. Persons living in collective dwellings and other specific institutions are not involved in the survey. The Household Budget Survey was conducted for the first time in 1999-2000 and was representative only for urban areas, continuing later on in 2006-2007, 2008-2009¹ and since 2014 is continuously. From 2006-2007 the survey is spread in the whole Albanian territory including urban and rural areas and also representative in prefecture level.

The Household Budget Survey in 2015 was conducted by INSTAT throughout the whole year, with a sample of 9024 households. At the end of the survey there were around 7335 interviewed households distributed uniformly in the whole Albanian territory. The households' response rate, calculated as the ratio of the number of interviewed households with the number of selected households, expressed as a percentage is 81.3 percent. The sample selection follows a two-step procedure. The first step units (PSUs) are the Census homogeneous² areas, with a proportional probability to the size of the Census area. In the second step, within each selected area in the first step, is selected by the method of systematic selection with equal probability a fixed number of 12 households. The selection in both steps is done in a random way by providing a representation also at the prefecture level. The total households sample was divided into 4 sub-samples of three months, which were geographically spread homogeneously throughout the year, to reflect the seasonal changes. Consequently, each month were interviewed about 752 households spread evenly.

Definitions:

Consumption expenditures of households include any kind of purchases made for goods and services made by households. It excludes purchases of durable goods, investments, money given to the others and imputed rent.

Mains Groups expenditures are classified according by the Classification of Individual Consumption by Purpose 2012.

Reference period is the duration of a certain subject that the information is collected on. The survey uses different reference periods depending on the type of information that must be taken and objectives of each matter to be analyzed.

Household is referred to a group of people, a related person or not, who live together in the same apartment or in a part of the house and share a partial or common economy.

Head of household is a person who is defined as the head for the purposes of the survey, (person who is the owner of the house or the person identified by other members of the family). If family members do not determine by themselves the person, he will normally be the person who contributes more to the income of the household.

Child is considered every person under 18 years old.

1 The period of the survey field work was: October 2006- September 2007 and November 2008- October 2009.

2 Homogeneous means that each Census area has the same characteristics of households' consumption expenditures and the size of each PSU has almost the same number of households or individuals.

Tab. 1 Average monthly and annually consumption expenditures of households and their structure, 2015

Main group of consumption	Average monthly and annually consumption expenditures		
	Value (in ALL/monthly)	Value (in ALL/annually)	Value (in %)
Food and non-alcoholic beverages	34,489	413,868	48.7
Alcoholic beverages, tobacco	2,507	30,084	3.5
Clothing and footwear	3,449	41,388	4.9

ECONOMIC INDICATORS

GROSS DOMESTIC PRODUCT

Introduction

National accounts reflect a country's macroeconomic developments and provide to users the main indicator and information for economic development.

National accounts play an important role in economic policy making and are the basis of information to demonstrate the development and structural changes of the economy. They show the productive capacity of a country how much is consumed, invested and exchanges with other countries of the world.

Since June 2014, Albania received the status of candidate country for accession to the European Union, status which is associated with a range of obligations to be fully aligned with EU standards. Part of these obligations is the development of statistics and particularly those of National Accounts, in accordance with the European System of National and Regional Accounts ESA 2010 that was implemented by EU Member States in September 2014. An intensive work is done in the field of national accounts statistics for the improvement and extension of macroeconomic indicators, in accordance with ESA 2010 and Nomenclature of

Economic Activities NACE Rev 2, which are reflected on the GDP figures. The implementation of new methodologies is very important as it ensures consistent, reliable and updated compilation of national accounts. In this way the description of the economy of a country and its regions is fully comparable with other countries economies.

Main Findings

Gross Domestic Product in current prices has continued to grow along the years 2011-2015, by assigning values of ALL 1,427,799 million in year 2015, from ALL 1,300,624 million of 2011.

During year 2015, Albanian economy performed a real GDP growth rate by +2,23% (in volume) compared with year 2014, after a growth of +1,77% in year 2014 compared with year 2013. Based on these results, GDP per capita in the year 2015 amounted to ALL 496 thousand (or EURO 3,547) from ALL 483 thousand (or EURO 3,450) in year 2014. The average GDP per capita of years 2011-2015 is ALL 470 thousand.

Table 1: National Accounts

Indicators	Unit	2011	2012	2013	2014	2015*
Supply (at current prices)	ALL Mln	1,976,650	1,966,865	1,984,002	2,053,817	2,066,548
GDP at market prices	ALL Mln	1,300,624	1,332,811	1,350,053	1,395,305	1,427,799

	USD	4,438	4,248	4,411	4,579	3,935

2015* Semi-Final

The structure of Gross Domestic Product according the three main economic activities groups does not reflect any significant change into it in years 2011-2015.

Services continue to represent the main share in the economy (with an average of 45, 22 %), followed by Industry and Construction (22, 63 %) and Agriculture, hunting and forestry (19, 32 %).

Table 2: Structure of GDP by economic activities (in %)

Economic Activities	Years				
	2011	2012	2013	2014	2015*
Agriculture, hunting and forestry	18.23	18.77	19.57	19.99	20.06
Industry and Construction	24.48	22.92	23.06	21.51	21.22
Services	44.26	44.95	44.61	45.78	46.49

2015* Semi- Final

Final consumption has the major share in the total economy, with 92.38 %. This component increased by 2.49 % in nominal terms and 0.89 % in real terms. In 2015, *gross fixed capital formation* represents 24.64 % of GDP and increased

by 4.03 % in real terms compared with 2014. *Exports of goods and services* increased in real terms by 0.97 % compared with 2014, while *imports of goods and services* decreased by 2.88 %.

Fig. 1 The Structure of GDP by expenditure approach, in %

The graph below gives the structure of the household's final consumption expenditure by main groups, for 2015. It is noted that the group "Food and non-alcoholic beverages" has the highest share among the other groups

and "Communication" has the lowest one. In a more general perspective, it is noted that expenditures for services make up 41.56 %, expenditures on food products 41.31 % and expenditures on non-food products 17.13 %.

Fig. 2 The structure of household final consumption expenditure in %, year 2015

Tab.3 Main Regional Indicators 2015

Statistical Regions level 2 / 3		GDP Current price	GDP Current price	GDP Current price	Share of AL	Contribution to real Growth	GDP per capita	GDP per Capita	GDP per Capita	GDP Per Capita index (AL = 100)
		mlln ALL	mlln Euro	mlln USD	%	%	thousand ALL	Euro	USD	%
AL	The Republic of Albania	1,427,799	10,218	11,335	100	2,23	496	3,547	3,935	100
AL01	North	336,634	2,409	2,673	23,6	1,22	404	2,890	3,206	81,5
AL02	Center	671,019	4,802	5,327	47,0	1,89	595	4,258	4,724	120,1

*Estimations for year 2015 are based on semi-final estimations

In year 2015 according statistical regions level 2, in Central region, GDP at current prices was 671.0 billion ALL or 47.0 % of the total GDP of the country. Compared to 2014, GDP at current prices increased by 4.2 %. GDP at current prices in South region was 420.1 billion ALL or 29.4 % of total of the

country. Compared to 2014, GDP at current prices decreased by 2.8 %. GDP at current prices in North region was 336.6 billion ALL or 23.6 % of total GDP. Compared to 2014, GDP at current prices increased by 5.3 %.

Fig.3 GDP per capita according to Statistical Regions level 3, year 2015*

The highest level of GDP per capita by Statistical Region Level 3, for 2015, is in Prefecture Tiranë with around 679 thousand ALL and has registered a growth with 5.5 % compared with 2014. GDP per capita for Prefecture Tiranë is 37.0 % above the national average. It is followed by Prefecture Fier with around 550 thousand ALL or 22.9 % and has registered a decrease with 9.6 % compared with 2014. GDP per capita for Prefecture Fier is 11.0 % above the national average.

The lowest level of GDP per capita by Statistical Region Level 3, for 2015, is in Prefecture Kukës with around 319 thousand ALL and has registered a decrease of 2.2 %, compared with 2014. GDP per capita for Prefecture Kukës is 35.7 % below the national average. It is followed by Prefecture Elbasan with around 351 thousand ALL and has registered a decrease of 0.5 % compared with 2014. GDP per capita for Prefecture Elbasan is 29.2 % below the national average.

Fig.4 The contribution of Statistical Regions to the Real Growth Rate of GDP, year 2015*

In 2015 the real growth rate of GDP was increase by 2.23 % compared to the year 2014. The contributions to the real growth rate of GDP for the statistical region level 3 are presented below: the highest contribution to the real growth rate for 2015 is in Prefecture Tirana with +2.1 p.p., followed by Prefecture Durrës with a contribution to the real growth rate of +0.76 p.p and Prefecture Dibër with a contribution to the real growth rate of +0.36 p.p. The lowest contribution to the real growth is in Prefecture Fier with -0.81 p.p., followed by Prefecture Elbasan with a contribution to

the real growth rate of -0.21 p.p. and Prefecture Gjirokaštër with a contribution to the real growth of 0.15 p.p.

In statistical regions level 3 the lowest share of GDP compared with the national level was in Prefecture Kukës 1.8%, and in Prefecture Gjirokaštër with 2.4%. The largest share of GDP was in Tiranë with 39.9%. In 2015 the share of GDP for Center Region had 47.0% of total of Albania. Share of GDP of Region South was 29.4% of total GDP. Share for Region North was 23.6% of total GDP.

Fig. 5 Share of GDP by statistical regions level 2, 3 year 2015

Methodology

GDP calculations are based methodologically on the basic concepts of the European System of Accounts (ESA 2010) and the System of National Accounts (SNA 2008) of the United Nations Organization (UN). Both these methodologies are the latest updates to the ESA 1995 and SNA 1993.

The European System of National and Regional Accounts (ESA 2010) is the newest internationally compatible EU accounting framework for a systematic and detailed description of an economy.

Gross Domestic Product (GDP) represents the total monetary value of all goods and services produced over a specific period of resident producing units within the economic territory of the country.

The main methods of calculating the GDP are:

- Production Approach;
- Expenditure Approach;
- Income Approach.

INSTAT estimates GDP only by the method of production and expenditure, with current and constant prices.

The compilation process of GDP by production approach can be summarized in two steps. In the first step gross value added (GVA) at basic prices of all branches is estimated as the difference between output at basic prices and intermediate consumption at purchases' prices less financial services indirectly measured FISIM.

GVA = Output – Intermediate Consumption – FISIM

In the second step taxes on products are added and subsidies on products are subtracted from the sum of gross value added of all branches to obtain GDP at market prices.

$$\text{GDP} = \text{GVA} + \text{Taxes} - \text{Subsidies}$$

Real growth of GDP is among the most important indicators of the system of national accounts. Compilation of GDP at constant prices is important to determine the annual real growth rate of GDP. GDP at constant prices is measured as sum of gross value added of all branches at constant prices plus taxes and minus subsidies on products at constant prices.

GDP by the expenditure approach implies relationships between four economic sectors, Households, Businesses, Government and Rest of the World and is measured as the sum of expenditure on goods and services of all those sectors. GDP by expenditure method is based on the below equation:

$$\text{GDP} = \text{C} + \text{I} + \text{G} + \text{NX}$$

C- Final Consumption,

I – Gross Fixed Capital Formation;
G- Changes in Inventories;
NX – Exports-Imports.

After the estimation of GDP at current prices by expenditure approach, it is done the deflation with price indices in order to obtain GDP at constant prices.

Regional GDP method

In general the production approach is used in the Albanian Regional Accounts. The same data sources are used for the estimation of the Production and Intermediate Consumption in regions as well as at national level.

The methods used to calculate Regional Gross Value Added (GVA) are a combination of the methods Bottom-Up, Mixed methods (Pseudo-Bottom-Up method) and Top-Down, in line with ESA manual chapter 13:

- Bottom-Up means that all information is collected from the local KAU and converted to the level of the National Accounts.
- Top-Down is the inverse method of bottom-up .It means that the aggregate of GVA in these sectors is allocated to a region and to an industry and not to the local units. The national figure is distributed using an indicator which is close to the value added
- Pseudo-Bottom-Up method is the mixture of Bottom-Up and Top-Down methods. The Pseudo-Bottom-Up approach in our case consists of assigning of regional weights to enterprises and data for local units are not available. Weights are determined according to the wages and salaries, nr of employees in the sum of local units in the regions. Many enterprises have local units only in one region and that is why calculation in this case is just as in a purely Bottom-Up approach.

Classifications

Classifications are essential for the production, compilation and dissemination of statistics. The statistical classification are updated continuously to better reflect the economic, technological and structural changes in the economy and to enable comparison and data connection at European level and in general, in the world as part of an integrated system.

Classifications used in National Accounts are:

- Nomenclatures of economic activities Rev. 2 (NACE Rev. 2).

The previous classification NACE Rev. 1.1 has been updated with new classification NACE Rev. 2 which introduces new concepts and higher levels of classification and new details that reflect different forms of production and emerging industries;

- Nomenclature of products (CP);
- Classification of Individual Consumption by use (COICOP);
- The classification of government expenditure by function (COIFOG);
- NUTS classification.

Data sources

Various statistical and administrative sources are used for the estimation of GDP. Data could be statistical products of INSTAT or administrative data from different national institutions such as Ministries, General Directorate of Taxes and Customs, National Registration Centre, Bank of Albania, Financial Supervisory Authority, National Agency of Natural Resources, etc. By comparing these sources with each other, it is obtained a clear picture of the economy which is comprehensive, consistent, coherent and fully integrated.

The statistical sources include data gathered from various records and surveys on entities or households, among which it could be mentioned: Business Register; Population and Housing Census; Structural Business Survey; Retail Trade Survey; Household Budget Survey; Labour Force Survey; Living Standard Measurement Survey; Price Statistics Survey, etc.

Administrative sources include administrative data collected by other institutions for various purposes, among which it could be mentioned: The annual financial statements; Value added tax (VAT); Monetary financial statistics; Balance of Payments; Government fiscal statistics; Foreign trade statistics; Data on electricity and energy products; etc.

Definitions

Output: Production is an activity carried out under the control, responsibility and management of an institutional unit that uses inputs of labour, capital and goods and services to produce outputs of goods and services. The total of products created during the accounting period is considered as output. There are three types of output such as: Market output; output produced for own final use; non-market output.

Intermediate consumption: Intermediate consumption consists of goods and services consumed as inputs by a process of production, excluding fixed assets whose consumption is recorded as consumption of fixed capital. The goods and services are either transformed or used up by the production services.

Taxes on products and imports: Taxes on products are paid taxation per unit of some goods and services like the Added Value Tax, excise and customs' tax on imports.

Subsidies on products and imports: Subsidies on products are non - reverse payment made by public administration units to the companies in the form of a certain amount of money per unit of goods or services. Subsidies in imports consist in subsidies of goods or services payable when the product surpasses the border of economic territory or if the services were made to resident institutional units.

FISIM: Some financial intermediaries provide services for which they don't explicitly charge their customers. Examples of these services are loans and deposits which the financial institutions offer interest rates for certain periods and in different currencies. The value of these financial intermediary services is indirectly measured and is abbreviated FISIM. FISIM is valued on the basis of the difference between the actual rates of interest on deposits and loans (respectively) of FIs and a reference rate of interest, multiplied by the respective stocks of deposits and loans. FISIM has to be allocated by economic activities and institutional sectors.

Basic Price: The sum, which the producer receives from the buyer per unit of product or service produced, excluding taxation on product and subsidiaries on it. (The basic price excludes transport expenses).

Market Price: The basic price after adding taxes less subsidies on products.

Current Price: Prices of reference period. It represents the price paid for goods and services in the production or consumption time.

Constant Price: Constant prices estimates are adjusted for prices changes relative to a base year. They are a way of measuring the real change in output.

Real Growth: The indicator used to compare the real growth rate at which a Gross Domestic product (GDP) and its components changes/grows from one year to another.

Final consumption: Final consumption is one of the basic components of GDP by expenditure method. It consists in goods and services used by separate families or communities and are calculated as the sum of final consumption of household, final consumption of general government and final consumption of non - profit institutions serving the households.

Final consumption of households: Final consumption of households contains all goods and services directly used to fulfill the individual needs of resident families.

Final consumption of General government and NPISHs: Is the value of non - commercial services ensured by General government and non - profit institutions to the profit of communities or groups of families. It is calculated as the difference between the general government production and NPISH s and their market production value.

Net Export: Net export is the difference between export of goods and services (f.o.b) and import of goods and services (f.o.b).

Gross fixed capital formation: GFCF consist of resident producer's acquisitions less disposals, of fixed assets during a given period plus certain additions to the value of non-produced assets realised by productive activity of producer or institutional units. Fixed assets are produced assets used in production for more than one year.

Changes in inventories: Is defined as the difference between inventories of stocks in process and circulating assets by the end of the year and beginning of the other one. Inventories include raw material and others, products, works and services in process, not finished and finished goods, animals etc.

Residence Principle: The main principle for allocation GVA in Regional Accounts is that GVA should be allocated to the region where the producer unit is resident (it means that GVA have to be allocated to region where is created).

Local KAU: The local KAU is an institutional unit producing goods and services, or a part of this goods and services, located in a single region. The local KAU is identified with the region where its centre of economic interest is, i.e. the region where the local KAU is physically located.

Multi-Regional Units: are producer units that have sites in more than one region and are active in more than one industry. Activities of the multi-regional units should be classified correctly to local KAUs

Uni-Regional Units: are producer units that have sites in only one region and are active in one or more than one industry.

CONSUMER PRICE INDEX

INTRODUCTION

The consumer price index (CPI) measures the change over time in the prices of consumer goods and services acquired, used or paid for by households. It is an important measure of inflation rate in Albania. It is only a measure of change in prices of products and services for personal consumption.

MAIN STATISTICAL FINDINGS

Indices-changes in time

The annual average change of consumer price index in 2016 is 1.3 %. The largest annual average increase by 3.6 % it is noticed in the "Education" group, while the largest decrease it was noticed in the "Transport" group by 2.8 %.

For the period 2012-2016 is noticed that the prices of goods and services for the whole basket have increased by 6.9 %. The largest increase it is noticed in "Alcoholic beverage and tobacco" group by 19.4 %, followed by groups "Education" by 18.4 %, "Food and non alcoholic" by 14.7 %, "Different goods and services" by 6.8 %, etc. The largest decrease of prices it is noticed in "Clothing and footwear" group by 8.1 %, followed by "Health" group by 7.5 %.

SOURCE OF INFORMATION

Retail prices are collected by price collectors through direct interview in the 11 Prefectures of Albania (Tirana, Durrës, Elbasan, Vlorë, Korçë, Shkodër, Berat, Lezhë, Dibër and Gjirokastër).

DEFINITION

The annual rate measures the price change between the current month and the same month of the previous year. This measure is responsive to recent changes in price levels but can be influenced by one-off effect in either month

The monthly rate measures the price change between current month and previous month. Although up-to-date it can be affected by seasonal and other effects.

The 12-month average rate compares average Consumer Price Indices against the latest 12 month to the average of the previous 12 months.

BUSINESS REGISTER

Introduction

This chapter presents Statistical Business Register (SBR); these data describe the development of enterprises over the years, their main characteristics, and the economic activity in which they operate. Business register is the backbone on producing economic statistics. The existence of statistical business register is of particular importance for the compilation of statistics required and to give short-term indicators and structural economic developments.

INSTAT has created administrative register of enterprises in 1994 and since 1998 maintains the statistical business register. Since 2010 Local Unite Register is maintaining as well as business register.

Business register hold legal unit (enterprises and institutions) that perform their economic activity inside Albanian territory. SBR is built in accordance with Council Regulation (EEC) No 177/2008 of 20 February 2008 on Community coordination in drawing up business registers for statistical purposes.

Statistical Business register is served for statistical purposes and clearly have to identify units in order to:

- Permit the collection of information about them via administrative sources;
- Provide a sampling base for surveys, coordination of surveys, and for grossing up survey results;
- Permit demographic analysis of the population of enterprises and their associated units.

Business Register 2016 holds also farmers registered to Regional Tax offices and are identifying with Number of Identification as taxation Person, NIPT. This is due to

pursuant to the directive of the Minister of Finance No. 19 dated 11.03.2014 "On enforcement regime scheme specific compensation for purposes of agricultural producers of Value Added Tax"

Findings

160,679 enterprises are active at the end of year 2016, of which 31,372 are farmers registered to tax offices with unique code. During 2016 are registered 31,377 active enterprises of which only 10.3 % are juridical persons; 30.4 % of active enterprises continue economic activity since 2011.

Economic activity

69.8% of active enterprises are producers of services; "Wholesale trade, except of motor vehicles and motorcycle" dominate in total economy by 31.9%.

Enterprises with main activity "Trade" and "Accommodation and food service activities" dominate with 46.1% of total active enterprises.

Enterprises with 50 and more employed to producers of goods are concentrated in manufactured activities

Producers of services continue to dominate in economy and mainly wholesale and retail trade. Trade activity continues to be the most favourite when decide for a new business, and represent 21% of total enterprises registered during 2016.

Fig. 1 Active enterprises by economic activity, 2016

Fig. 2 Active enterprises by prefectures and administrator gender, %

Size of enterprises

Big enterprises with 50 and more employed represent only 1.1 % of total enterprises and their contribution on employment is 48.3 %. Approximately 91 % of enterprises are enterprises from one to four employed. Mostly of them, 74.8 % have only one employee.

About 54.7 % of total active enterprises are located to Tirana, Fier and Korça . Prefecture of Tirana counted highest

number with 53,405 enterprises and the prefecture of Kukës counted the lowest ones with 1780 enterprises.

Dominance of producers of services is a phenomenon in all prefectures and mostly Trade activity.

Foreign and joint enterprises

Enterprises with foreigner owner or foreigner and Albanian partners account for 3.5 % of total active enterprises and employ 12.8 % of total of employment.

Big enterprises in this group carry out economic activity mainly in: call centre, producers of clothes and shoes and financial activity.

Foreign and joint enterprises are mainly in prefectures of Tirana and Durres with 80.9% (Foreign and joint enterprises are mainly in prefectures of Tirana and Durres, with 80.9%)

Enterprises from European countries represent 68.8 % of total foreign and joint enterprises, from which of 56.4 % have origin from Italy and Greece.

Female owner/administrator

In 2016 women as owners /administrators are 26.8 % of total active enterprises. Concentration of women as owners or administrators is higher in trade activity with 43.5 %.

The highest percentage of enterprises led by women is in prefecture of Tirana with 40.7%.

Enterprises led by women are mainly micro enterprises with 1-4 employed and represent 92.8 % of this group.

However 19.2 % of big enterprises, with 50 and employed managed or owned by women

Local units

In 2016 are 173.361 active local units of which 159,023 have just one location

Multi-location enterprises are 1,656 and represent only 1% of total number of active enterprises and employ 28.9 % of total employment.

In Tirana operated 32.9 % of total active enterprises.

Fig. 3 Ndërmarrjet aktive dhe regjistrimet , 2012-2016

Sources

Business register (SBR) includes all legal units registered to Tax offices and since 2007 is using National Registration Business (NRB) information. Legal units are identifying by unique code, NIPT, and carrying on economic activities to Albanian territory.

Business Register is maintaining from administrative sources and surveys conducted by Institute of Statistics and other statistical agencies.

Administrative sources:

- National Registration of Business ;
- General Directory of Taxation;
- VAT file
- Annual account of enterprises.

Statistical sources

- Business register survey;
- Annual Structure Survey;
- Quarterly survey;
- Production Price survey;
- Other surveys.

Definitions

Legal unit

Legal unit is not direct statistical unit. Legal unit can be:

Legal person, whose existence is recognized by law independently of the individuals or institutions which may own or are members of him;

Physical person, who is engaged in an economic activity in its own right.

Enterprise

An enterprise is: "the smallest combination of legal units that is an organisational unit producing goods or services which benefits from a certain degree of autonomy in decision-making, especially for the allocation of its current resources. An enterprise carries out one or more activities at one or more locations (local unit)".

The relationship between an enterprise and a legal unit is therefore defined as: "the enterprise corresponds either to a legal unit or to a combination of legal units".

Local unit

The local unit is an enterprise or part thereof (e.g. a workshop, factory, warehouse, office, mine or depot) situated in a geographically identified place. At or from this place economic activity is carried out for which - save for certain exceptions - one or more persons work (even if only part-time) for one and the same enterprise.

NACE classification

The classification of Economic Activities (NACE) is a four-digit classification performed by different subjects. The classification in Albania is adopted by Government Decision No. 320, date 28.05.2014.

FOREIGN TRADE

Introduction

This chapter contains information about the exchange of goods between Albania and other countries of the world. External trade statistics of goods are a very important instrument for decision makers in the public's and private sectors. They help in the preparation of bilateral and multilateral negotiations in the context of trade policy and for the assessment of market economies. They assist companies in market research and in determining their trading strategies.

Goods trade statistics includes data on foreign trade of goods, exports-imports of goods in Albania. For this reason

goods trade statistics compile exports (FOB) and imports (CIF) and some other detailed statistics, for example exports/ imports by partner countries, group of country, group of goods, etc.

During the 5-year period (2012-2016) the average annual increase for exports is 4.6 % and 1.4 % for imports. During this period, the average annual decrease of trade deficit is 0.2 %.

Fig. 1 Foreign trade of goods 2012-2016

Foreign trade by group of products

The products that dominated the exports for the 5 years period (2012-2016) were manufactured products exports. For 2016 the most exported product groups are: "Manufactured products" with 64.5 %, increased by 7.3 % on annual average during 5-year period (2012-2016), "Minerals fuels and lubricants" with 11.3 %, decreased by 2.8 % on annual average and "Crude materials" with 9.6 %, increased by 1.8 % on annual average.

The groups of products that dominated the imports for the 5 years period (2012-2016), are: "Manufactured products" with 39.1 %, increased by 5.3 % on annual average, "Transport machinery and equipments" with 21.9 %, increased by 3.9 % on annual average and "Chemical products" with 11.8 %, increased by 5.5 % on annual average during 5-year period (2012-2016).

Fig. 2 Exports by several commodity groups

Fig. 3 Imports by several commodity groups

Foreign trade by partner countries.

During this period (2012-2016), exports in absolute terms increased significantly to Italy, Germany and Greece. Compared with five years ago, a map of Albanian exports is significantly diversified.

In 2016: Partner with the largest weight in exports with Albania is Italy that occupies 54.6 % of total exports, having an average annual increase by 5.1 % during 5-year period (2012-2016); Second largest trade partner in exports is Kosovo that occupies 6.8 % of total exports, having an average annual increase by 3.7 %; The third largest trade partner in exports is Greece occupying 4.6 % of exports, having an average annual increase by 3.1 %; The fourth largest trade partner in exports is Germany occupying 3.4 % of total exports, having an average annual increase by 9.8 %. Other countries that occupied a significant weight in the structure of exports in 2016 were: Malta with 3.3 %, Spain 3.3 %, China with 3.1 %, Macedonia with 2.6 %, etc.

annual increase by 13.6 % during 5-year period (2012-2016); The third largest trade partner in imports is China occupying 8.8 % of the total import, having an average annual increase by 8.1% during 5-year period (2012-2016); The fourth largest trade partner in imports is Greece occupying 7.9 % of total imports, having an average annual decrease by 3.8 % during 5-year period (2012-2016). Other countries with a largest weight in the structure of import in 2016 were: Turkey with 7.9 %, Serbia with 3.1 %, Spain with 2.2 % and France with 2.0 %, etc.

In 2016 exports to the EU countries occupied 77.9 % of exports, having an average annual increase by 6.1% during 5-year period (2012-2016); while exports to Euro zone countries occupied 72.3 % of exports, increasing by 5.3 % on annual average, during 5-year period (2012-2016).

In 2016 imports from the EU countries occupied 63.2 % of imports, having an average annual increase by 0.8 % during 5-year period (2012-2016); while imports from Euro zone countries occupied 55.2 % of imports, increasing by 0.9 % on annual average, during 5-year period (2012-2016).

Fig. 4 Partnerët kryesorë në eksporte

Imports from Greece decreased during 2012-2016 period, while imports from Italy, China, Turkey and Germany increased during this period.

In 2016, partner with the largest weight in imports is Italy with 29.3 %, having an average annual increase by 0.4 % during 5-year period (2012-2016); Second partner is Germany occupying 9.5 % of imports, having an average

International transport of goods by road is the most common mode of transport for export/importing of goods during 2012-2016. During this period the annual average of the value of goods transported by sea is 71.6 % and by road 26.3 % of total exports. While, for import the annual average of the value of goods transported by sea is 53.3 % and by road 38.1 % of total imports.

Fig. 5 Main partners in imports

Source of data

The Customs General Directorate is the main source for collection of data related to foreign trade. These data are collected monthly through the Custom's Declaration, which was introduced in Albania since 1992. This declaration serves for both customs and statistical purposes. It includes data related to time of transactions, kind of transaction, sort of goods, gross weight, net weight, statistical value of goods, country of origin, exporting country, destination, kind of concession, etc.

The complex characteristics of the customs activities and statistical needs make it indispensable to introduce the classification of goods.

The Harmonized Commodity Description and coding System (Harmonized System, or HS) or extended versions based on HS, such as the Combined Nomenclature used by our country provides such details. Classification using these nomenclatures is based on the nature of the commodity.

Commodity categories more suitable for economic analysis are provided by the Standard International Trade Classification (SITC), which classifies commodities according to their stage of production.

The nomenclature used for other sectors of INSTAT needs, are: Classification of Products by Activity (CPA) and the Nomenclature of Economic Activities (NACE) for national accounts and business statistics needs.

Foreign trade statistics record all goods, which are added or subtracted from the material stock resources of a country by imports or exports entering or leaving a territory of a country. Goods to be included in the foreign trade statistics include non-monetary gold, not-emitted "barter" agreements, goods traded on government account and food and other humanitarian aids.

Goods simply being transported through a country (transit goods) temporarily admitted or withdrawn (inward or outward processed goods) do not add or subtract from the stock of material resources of a country and are not included in the foreign trade statistics. Goods to be excluded from the international merchandise trade statistics include monetary gold, emitted banknotes securities and coins in circulation, temporarily admitted goods, transit goods, etc.

INSTAT collects, processes and distributes statistics of foreign trade of goods in accordance with the Law on Statistics, Statistical Officer Programme (SAP) and in line with the recommendations of the United Nations, included in the "international Trade Statistics concepts and definitions" manual, published in 1998, revised in 2014, where Eurostat methodology is based too. Concepts and methods are adapted to integrate statistics on foreign trade of goods internationally.

Data on foreign trade of goods are processed based on the principles of special trade system.

Definitions

Exports - In general are goods destined to be sent to a third country, subject to customs regime or outside processing arrangements, or re-exported following inside processing.

Imports - In general are goods coming from a third country and are directly unloaded or placed to a warehouse according to the customs procedures to accomplish free zones processing, active or customs processing.

Trade Balance - Is the difference between exports and imports.

The FOB value - Used for evaluation of exports, includes the value of transaction of goods, as well as the value of services required for delivery to the border of the exporting country.

The CIF Value -Used for evaluation of imports, includes transaction value of goods, value of services performed for

delivery of goods to border of exporting country as well as the value of service to perform delivery of goods from the border of the exporting country to that of the importing one.

EU countries:

Belgium, Germany, France, Italy, Luxembourg, Netherlands, United Kingdom, Denmark, Ireland, Greece, Spain, Portugal, Austria, Finland, Sweden, Latvia, Lithuania, Estonia, Hungary, Czech, Slovakia, Slovenia, Cyprus, Malta, Poland, Bulgaria, Romania, Croatia.

Euro zone countries:

Belgium, Germany, France, Italy, Luxembourg, Netherlands, Ireland, Greece, Spain, Portugal, Austria, Finland, Latvia, Lithuania, Estonia, Slovakia, Slovenia, Cyprus, Malta.

AGRICULTURE

General description

Agriculture sector is one of the most important sectors of the economy in Albania. Agriculture product is a part of the regional identity of with a wide range of environmental, nature and climate qualities.

The statistical information regarding crop statistics is based on the data collected from the Ministry of Agriculture and Rural Development, as well as on surveys, administrative data and expert estimations. The legal basis for collection of crop statistics is provided by official Statistics National Program 2017-2021.

Main cereals cultivated in our country are wheat, maize, rye, barley and oats. An important share of field crops is formed by vegetables, potatoes and white beans.

The main groups of fruit trees cultivated in our country are fruit trees (apple, pear, peach, plum, cherry, nut, etc.), olive, citrus and grapes.

Finding

In 2016, there were produced 1129101 tonnes of vegetables, with an increase of 9.6% compared with the year before.

The highest level of production of vegetables thrives in the prefecture of Fier, Tirana and Berat, respectively 373406; 121661 and 120105 tonnes. Gjirokaster and Kukes prefecture have lower levels of production of vegetables, respectively 13714 and 14171 tonnes.

In Albania, the most important vegetables in terms of production of vegetables are (watermelons and melons) with 25.1%, tomatoes with 25.2%, dry onions with 8.8%, cucumbers with 8.3% and peppers 6.8%.

In 2016, were produced 261754 tonnes of fruit trees, with an increase of 7.6% compared with the year before. The highest level of production of fruit trees thrives in the prefecture of Korçe, Elbasan, Fier and Berat while Gjirokaster, Lezha and Vlora mark the lowest level of fruit trees production. Data on fruit trees production includes fruit trees on the block and scattered trees.

Fruit trees include fruit trees and scattered fruit trees. The most important fruit trees in terms of production to total production are apples with 38.9%, plums with 15.4%, figs 8%, peaches 7.2% and pears 5.1%.

Albanian climatic conditions favor the production of olive. In 2016 production of olives was 99 075 tones, with an increase of 3.2% compared with the year before. Data on olives production includes olives in the block and scattered trees. The highest level of olive production in Albania is concentrated in the lowlands and coastal with Mediterranean climatic condition: in the prefecture Fier,

Berat, Elbasan and Vlora. The contrary can be said to north-eastern areas, cold climates, where the olive is not cultivated. In these areas included prefecture of Kukësi, Korça and Dibra

Citrus production in 2016 increased by 33.3% compared with the previous year. Citrus the most representative in terms of total production are mandarin with 50.4%, orange with 25.3% and lemon 9%.

Grapes are cultivated in all prefectures of the country. In 2016, were produced 205000 tonnes of grapes. Data for the production of grapes include grapes from vineyards and pergola.

Definitions

Land use

The total area is the entirety of the economical units' territory composed of the sum of the utilised agriculture area (UAA) and other land.

Utilised agricultural area composed by:

- arable land,
- permanent crops,
- kitchen gardens used by the holding and
- permanent grassland,

Arable land

Arable land (ploughed or tilled) regularly, generally under a system of crop rotation. Crop rotation is the practice of alternating annual crops grown on a specific field in a planned pattern or sequence in successive crop years. Normally the crops are changed annually, but they can also be multi-annual. To distinguish arable land from permanent crops or permanent grassland, a threshold of five years is used. The area cultivated with field plants is the area planted with these kinds of plants in a given agricultural year. Here we speak of an area with main crops (primary). The main crops (primary) normally have a greater economical value than the other cultures and occupy the land in the most part of the year. The main crops are wheat, spring cultures like the grain maize, potatoes, the legume, industrial plants, the alfalfa, etc.

Kitchen gardens

Areas devoted to the cultivation of agricultural products intended for self-consumption by the holder and his household, normally separated off from the rest of the arable land, and recognisable as kitchen gardens.

Permanent crops

Permanent crops area is area of land with fruit trees, olives, citrus and vineyards. Here are included only area with permanent crops in blocks.

Permanent grassland

Land used permanently (for five years or more) to grow herbaceous forage crops, through cultivation (sown) or naturally (self-seeded), and that is not included in the crop rotation on the holding. The land can be used for grazing or mown for silage, hay or used for renewable energy production.

Other land

- The forests are the area occupied with forests presents those territory extinctions in which there are forest woods, woods or bushes which produce timbering and other forest productions.
- The unutilised agricultural area is the land area sufficiently able for agricultural production but for some

reasons it hasn't been used in the given agricultural year.

- Other land is land occupied by buildings, farmyards, tracks, ponds, quarries, infertile land, rock, etc.

Harvest year

Harvest year' means the calendar year in which the harvest begins.

Area under cultivation

Area under cultivation means the area that corresponds to the total sown area, but after the harvest it excludes ruined areas (e.g. due to natural disasters). In area under cultivation included main and secondary area of crops.

Production area of permanent crops

Production area', in connection with permanent crops, means the area that can potentially be harvested in the reference harvest year. It excludes all non-producing areas, such as new plantations that have not yet started to produce, extensive production or abandoned area.

LIVESTOCK

Introduction

Livestock has been and remains one of the most vital sectors for the economical and social progress of the country. From livestock, are obtained precious food products, meat, milk, eggs, honey. Livestock covers all domestic animals, regardless of the age and location or purpose of the growth. This category includes animals like: Cattle, sheep and goats, pigs, equidae, poultry, bees.

Methodology

The assessment on the number of animals is based in the changing stock for each category of cattle, sheep, goats and pigs.

The assessment of milk production from cows is performed based on their average annual number resulting from the changes of stock and the average yield of milk per cow. The same logic is applied for the production of milk from sheep and goats.

The assessment of meat production for each category is based on the number of slaughtered cattle, sheep, goats, pigs and poultry and their live weight during the calendar year.

Main statistical findings

Number of heads. Referring to the structure of livestock in cattle unit, the cattle have the largest number of heads with 47.5 % of the total number. The sheep and goats are 30.0 %, pigs 5.9 %, poultry 9.0 % and equidae 7.6 % of the total number of heads of livestock unit.

Livestock: Cattle number in 2016 was 492 thousand heads, decreasing with 2.3 % compared to 2015.

Sheep: Number of sheep in 2016 was 1.972 thousand heads, increasing with 2.7 % compared to 2015.

Goats: Goat's number in 2016 was 941 thousand heads, increasing with 0.9 % compared to 2015.

Poultry: Poultry number in 2016 was 8.326 thousand heads, decreasing with 2.8 % compared to 2015.

Pigs: In 2016 number of pigs was 181 thousand heads, increasing with 5.3 % compared with the previous year.

Beehives: Activity of farmers in some areas of the country is developing in terms of breeding bees. In 2016 number of hives was 303 thousand, increasing with 10.5 % compared to 2015.

Livestock Production

Milk production. For the year 2016 total milk production is 1.145.000 tonnes. The structure of milk production is: cow milk 85 %, sheep milk 8 % and goat milk 7.0 %.

Cow's milk production from cows for the year 2016 is 975,000 tonnes or 1.1 % more compared with 2015. Milk yield per cow in country level is 2740 Kg/ head.

Sheep milk production for the year 2016 is 18.8 % less than the year 2015. Productivity per sheep in country level is 59.5 Kg per head.

Goat's milk production for the year 2016 is 6.1 % higher than the year 2015. Milk yield per goat in country level is 119 Kg per head.

Meat live weight

Meat live weight production for the year 2016 is 160,000 tonnes or 1.27 % higher compared with 2015. Meat production structure for the year 2016 is: bovine 45.0 %, sheep and goats is 32.0 %, pigs 11.0 % and poultry 12.0 %.

Other livestock products

Eggs production for the year 2016 has been at the same level as in the year 2015. In 2016, honey production has increased with 22.5 % compared with 2015.

Milk and dairy products in Agro-industry

In 2016, the quantity of milk collected is approximately 125 thousand tonnes decreasing with 0.17 %, compared to 2015. In this period, the quantity of cows' milk delivered to dairies is approximately 103 thousand tonnes, decreasing with 2.25 % compared to 2015. On the other hand, in 2016 the quantity of ewes milk collected is around 13 thousand tonnes with an increase of 0.12 %, compared to the previous year. Milk collected from goats is around 9 thousand tonnes, increasing with 0.06 %, compared to 2015.

In 2016, the quantity of drinking milk produced is around 11 thousand tonnes, decreasing with 1.13 %, compared to 2015. To the total quantity of drinking milk produced in 2016, semi-skimmed milk shares approximately 35.97 %, whole milk 58.5 %, raw milk 4.86 % and skimmed milk 0.67%.

Cheese quantity produced by origin in 2016 rose by 5.37 %, compared to the previous year. Processed cheese rose with 9.32 %. Rendered butter production has increased with 56.19 %, meanwhile the traditional butter production decreased by 15.7 %, compared to the previous year.

FISHING

Introduction

Fishing is an important sector of Albanian economy. Data on fishing are taken from General Directorate of Agricultural Services and Fishing in the Ministry of Agriculture, Rural Development and Water Administration.

The data are collected on monthly basis by inspectors at county level directly to vessels. Water category of fishing are; marine, costal, lagoon, inland water, aquaculture and mollusc.

Fishing - Includes all data of fleet activity and the capacity production, by different fishing area.

Fleet - Is total number of fishing vessel which uses fixed resource.

Fishing capacity - Catch by species, and fishing area.

Aquaculture - It is defined as the farming of aquatic species. Include fish, molluscs, crustaceans and aquatic plants.

Fish caught - Data refers to the caught quantity of all species of fish, crustaceans, molluscs etc., in seas, brackish water, and aquatic plants with fingerlings.

Main statistical findings

Marine fishing accounts for 64.8 % of total fishing, inland waters account for 13.6%, coastline 13.3 % and lagoons 8.3 % of total fishing. Aquaculture is cultivated more in the district of Saranda, Vlora region, with a share of 78.9 % of the total production. Mollusks are cultivated only in the district of Saranda, Vlora region.

In 2016, the quantity of fish caught was 4,368 tonnes from 4,128 tonnes in 2015, increasing in annual terms by 5,8 %. Aquaculture has declined in 2016 by 35 % compared to the previous year.

FORESTS

Introduction

The Forest area constitutes 36.6 per cent of the Albanian forestry area and the pasture 15.6 percent.

Fig. 1 Forests by the way of governance

Fig. 4 Network of protected areas

Definitions

“Forestry fund” are all forest areas and non-forest small surfaces included, forest resources on attachment, related infrastructure, including surface bare which create a harmonious environment with forests and forest land (openings, cliffs, dunes and sandbanks), forest belts defense, isolated groups of trees and shrubs.

“Forest” is land with a group of dense forest trees in stable form or other vegetation rare forest with an area larger than an acre and land cover scale not less than 30 per cent, which produces wood mass, exerts influence on the surrounding environment and provides the functions of the forest.

“Wood cutting” represents the cutting operations and the extraction of timber from forests.

“Pasture Fund” is all area of natural pastures and meadows, trees and bushes within their surfaces used for grazing outside the agricultural land fund. «Protected area» declared land, water, marine and coastal certain protection as biological diversity, natural and cultural assets, other natural attachment related.

“Strict nature reserve” is territory greater than 50 ha, with special natural values, shaped by natural ecosystems or easily changeable, representing bio-centers and bio-corridors with national and regional importance.

“National Park” Territories usually not less than 1000 hectares, unique in national and international values large portion of which are natural ecosystems affected probably by human activity.

“Natural Monument” Natural formation (including wood special), with an area up to 50 hectares, the formation of the special geological and geo-morphological, a deposit of minerals or a habitat of a rare type of trees or importance of particular scientific value and esthetic.

“Natural Park” territories representing bio-centers and bio-corridors with regional and local importance or areas with plants, animals, minerals and paleontological findings, specially protected or areas used for research purposes, educational and cultural as well.

“Protected areas of managed resources” Areas that include large areas of territory and relatively isolated and uninhabited, introduction of difficulty or regions that are sparsely populated yet and that may be under pressure to be populated and the most widely used and return them for intensive use is unclear or inadequate.

Key findings

Main statistical findings

The general area of the forest land fund in 2015 was 1.052 million hectares, with general volume of wood about 55 million m³.

In 2016 is noted there is no change in surface or volume compared to 2015.

RESULTS OF STRUCTURAL SURVEY OF ENTERPRISES

Introduction

This chapter presents structural business statistics and contains detailed information for nonagricultural enterprises broken down by economic activities and size class of enterprises. A large number of indicators are provided by annual survey of enterprises.

The main aim of structural business statistics is to show the structure of business sector through information gathered from the survey of active enterprises engaged in an economic activity. The priorities are define conform to European Regulation for Structure Business Statistics, No. 58/97, 20 December 1996 amended, by European Regulation No. 295/2008.

Structural Business Statistics serve for business community, policy makers and academics to undertake detailed analysis for economic structure of enterprises to present the economic and financial reality of enterprises and respond to the increasing demands for statistical information of decision makers, researchers and academics in Albania by providing transparent, neutral and timely statistics.

Structural business statistics allow a detailed analysis of small and medium enterprises (SMEs), which are the focus of policymakers, analysts and focus on entrepreneurship and role of SMEs.

Main findings

Number of active economic enterprises in 2015 was 104,534, which increased 22.7 % compared to 2014. By economic activity, enterprises that operate in trade sector comprise 43.1 %, while based on the size class analysis, enterprises with 1-4 employed are those which prevail with 89.3 % where services producers dominate with 80.3 %.

In 2015, the number of total employed increased by 64,550 employed or 17.4 % compared to 2014. Goods and services producers have contributed respectively by +4.2 percentage point and +13.2 percentage point (p.p) in the total increase of employed.

Turnover in 2015 reached 1,802 billion ALL, which indicated an increase of 3.6 % compared to 2014. Turnover of services producers constitutes 66.0 % of total turnover for 2015 and contributed by +1.9 p.p in annual increase of turnover.

In 2015 enterprises invested 208 billion ALL compared to 181 billion ALL that were invested in 2014 or 14.9 % more. The situation for investments is different compared with other main indicators because goods producers have the major contribution on investments increase. Investments of this group constitute 61.8 % on total investments for 2015.

The figure 1 presents the growth rate of main indicators of number of enterprises, employed, turnover and investments resulted by the comparison of the survey results for 2015 with 2014 for total activities covered in the survey as well as the growth rate of goods and services producers.

Fig.1 Percentage change of growth rate of number of enterprises, employed, turnover and investments 2015/2014

Based on Annual Structural Survey results is concluded that turnover per employed in 2015 is decreased 11.7 % as result of an higher increase in number of employed (17.4 %) compared to the turnover increase (3.6 %).

The same situation is reflected in the goods and services producers where turnover per employed decreased respectively by 5.8 % and 14.9 %. The decrease of indicator

resulted by a higher increase of employed (respectively by 11.4 % and 21.0 %) related to the turnover increased (by 5.0 % and 2.9 %).

Turnover per employed for goods and services producers as comparison of two years, 2014-2015 is presented in the figure 2.

Fig.2 Turnover per employed, 2014 -2015

Most of the enterprises, 87.3 %, operate in the service activities and mainly in trade sector (including trade of vehicles, wholesale and retail trade). In trade sector operates 43.1 % of enterprises which constitute 48.3 % of total annual turnover realized. Trade sector contributed by +0.1 p.p in the total turnover increase (3.6 %).

Trade sector engaged 25.7 % of the total number of employed. In trade sector investments are only 13.3 % of the total value of investments made in all economic activities covered in the survey.

Turnover in other services sector (private health and education, administrative and professional, scientific and technical activities etc.) increased 19.6 % compared with previous year. This sector had the highest increase of all main indicators for services producers. Investments increased in all activities of services producers compared with the previous year where resulted with a decrease.

A detail structure of main indicators for 2015, by economic activities for services producers is presented below in figure 3.

Fig. 3 Basic indicators structure by economic activities for services producers, 2015

Enterprises of producers of goods, including mining and quarrying, manufacturing, electricity, gas, water supply and waste management and construction sector has approximately 34.0 % of the total turnover realized.

Manufacturing sector dominate in producers of goods in number of active enterprises (7.8 %), employed (19.1 %) and turnover (11.1 %).

Sector of electricity, gas, water supply and waste management has the largest percent of investments in goods producers by 28.6 %.

In goods producers, mining and quarrying sector has the lowest increase rate in number of active enterprises (1.2 %) as well as the lowest increase on employment (5.2 %). Turnover and investment for mining and quarrying sector decreased respectively by 25.4 % and 35.7 %.

A detail structure of main indicators for 2015, by economic activities for goods producers is presented in figure 4.

Fig.4 Main indicators structure by economic activities for goods producers, 2015

The production is an activity carried out under the control and responsibility of an enterprise, which combines the sources of employed and capital, goods and services to produce goods and services.

Below (Figure 5) is presented the structure of production as a percentage for each of size class of enterprises for 2015.

Fig.5 Production structure by enterprises size class, 2015

In total active enterprises in 2015, were employed 435,437 persons. Enterprises with 50 and more employed have engaged 38.9 % of the total number of employed which has realized 45.0 % of total turnover and has invested 63.2 % of total investments even this group constitutes only 1.0 % of active enterprises. In this size class of enterprise with 50 and more employed, goods producers dominates on the number of active enterprises (54.2 %), employed (53.6 %) and investments (67.8 %).

Enterprises with 1-4 employed engaged 33.2 % of the total employed and realized 14.3 % of total turnover. This size class of enterprises dominate in services producers on number of active enterprises (89.9 %), employed (88.4 %), turnover (83.8 percent) and investments (53.4 %).

Based on the results of 2015, enterprises with 50 and more employed has contributed by +2.0 p.p in total annual growth rate of turnover. This contribution is almost the same as the contribution of enterprises with 10-49 employed.

Accommodation and food services sector is the only sector where enterprises with 1-4 employed generate the major percentage of total value added. Enterprises with 10-49 employed generate the major percentage of total value added in trade sector. In all other sectors, the major percentage of the total value added is generated by enterprises with 50 and more employed.

Fig.6 Value added structure by economic activities and enterprise size class, 2015

Source of data

The main aim of structural business statistics is to show the structure of the business sector with regard to economic data.

Statistics are presented by economic activity, classified by Statistical Classification of Economic Activities (Nace Rev 2) and size class of enterprise which are classified by number of employed 1-4, 5-9, 10-49, 50 and more employed.

The economic activities include all enterprises that produce goods or services for the market. Agriculture, hunting and fishing activities, financial and insurance activities, public and defence administration; compulsory social security and extraterritorial organizations and bodies are not part of the survey.

Data are collected for calendar year. The fiscal year corresponds to the calendar year.

Enterprises are classified on size classes by number of employed (measured as employed on a full-time basis).

The statistics comprise all active enterprises in Albania, of all legal forms. The population consists of all enterprises that, according to statistical business register were active in December of the reference year.

Enterprises with 1-9 employed are surveyed by sample survey. Enterprises with 10 and more employed are surveyed exhaustively.

Definitions of variables

An enterprise is: "the smallest combination of legal units that is an organisational unit producing goods or services which benefits from a certain degree of autonomy in decision-making, especially for the allocation of its current resources. An enterprise carries out one or more activities at one or more locations (local unit)".

The relationship between an enterprise and a legal unit is therefore defined as: "the enterprise corresponds either to a legal unit or to a combination of legal units".

Employed is defined as the total number of persons who work in the observation unit including proprietors, employees and unpaid family workers.

Turnover comprises the totals amount invoiced by the observation unit during the reference period, and this corresponds to market sales of goods or services supplied to third parties.

Investments during the reference period includes the goods, whether bought from third parties or produced for own use, having a useful life of more than one year including non-produced tangible goods such as land.

Value added at basic prices is calculated as difference between production value and intermediate consumption.

SHORT TERM STATISTICS

Introduction

This chapter gives information on economic indicators of enterprises showing development of Albanian economy in monthly and quarterly periods. The information used for calculation of these indicators comes from different quarterly surveys (with monthly information) and administrative data. These indicators are calculated and published according to STS EU regulation and user's needs. These indicators help to understand development of economic cycle and also to do forecasts for the near future.

The Statistical Business Register for all legal form of enterprises is used as a frame for sampling. The classification used is NACE Rev.2. The activities covered are: Industry, Construction, Trade, Transport and storage, hotels, Bar – restaurants, Information and communication, Architectural and engineering activities, Travel agency.

Indicators on Industry cover: Production volume index by industrial activities, Producer price index, Turnover volume index, Employees and Wages and salaries indices.

Indicators on construction cover: Volume index by type of construction, Construction cost index (for dwellings), Turnover volume index, Employees and Wages and salaries indices, Building permit issued. Indicators on Trade and other services cover: Turnover volume index, employees and wages and salaries indices. All data is in form of indices and percent changes.

Main statistical findings

In 2016, the industrial production volume index decreased by 19.3 % compared with previous year. Mining and Quarrying activities signed the higher decrease by 36.1 %.

Production volume index in Construction increase by 5.1 % compared to 2015.

Annual changes of Employed index in Industry and Construction activities are respectively 5.2 % and 6.2 %.

Producer price index signed a decrease in annual terms referred 2013 – 2016 periods. Higher decrease signed "Mining and Quarrying" activity by -3.3 %.

During 2012 – 2016, were issued 1402 building permits from which 60.1 % of the total for residential buildings.

Turnover volume index in Services activities represent positive change rate during 2012 – 2016.

Annual percent change of Turnover volume index in Services is +5.1% compared with 2015.

In Retail Trade, the Turnover volume index signed an increase by 6.6 % compared with previous year. A considerable annual growth rate shows the sub-group "The retail sale in non-specialised store with food, beverages or tobacco predominating" by 8.6 %.

Data sources and availability

The Short term Business Statistics are arranged by the law "On the Official Statistics" and by Regulation of European Council (EC) no.1165/1998, changed

The data are collected directly in the enterprise based on face to face interview by enumerators and are accessible like monthly, quarterly and annually data.

The NACE Rev.2 classification has been implemented for STS on first quarter 2014. At the same moment of implemented of NACE Rev.2, it was change even the base year from 2005 = 100 to 2010 = 100, and the weights were updated from SBS 2005, with the weights of SBS 2010, since 2013. According to the recommendation of EUROSTAT and the Swedish Assistance, the weights of 2015 are updated by using the weights of SBS 2013, (y-2), after Chain – Link method.

Scope of observation – based on their main activity, the enterprises that have been included in the survey are those whose activity covers: Industry, Construction, Trade, Transport and storage, hotels, Bar – restaurants, Information and communication, Architectural and engineering activities, Travel agency.

Model – The enterprises sample is selected using Statistical Business Register of enterprises. The enterprises with 1 – 9 employees are surveyed by sample, whereas those with 10+ are surveyed exhaustively.

In Retail trade the enterprises with 1 -4 employees are surveyed by sample, and for the units with 5+ employees are surveyed exhaustively.

Definition of the main indicators

Production Index – The objective of the production index is to measure changes in the production of goods from the current period to the base.

Producer Price Index – measures the price movement of selling price received by domestic producers for their output.

Construction Cost Index – measures the price movement of the production factors raw materials, labor, machinery, transports, energy and other costs that are used in building projects.

Turnover – Turnover comprises the total amounts invoiced by the enterprise during the reference period, which correspond to the resale of goods without any further transformation, excluding the VAT but including subventions and other duties and taxes on goods.

Turnover Index – The purpose of this index is to show the development of the market of goods and services in the current period compared with the base.

Employees' index – shows the evolution of employment in observation units in current period compared with base period.

Wages and salaries – this indicator is defined as the total remunerations, in cash or in kind payable (in ALL) to all persons counted on the payrolls, in return for works done during the reference period.

Wages and salaries index – shows the approximated development of the wages and salaries, in observation units, in a current period compared with the base period.

Retail Trade indices – have a particular importance because of retail trade role as an interface between producers and final consumers, allowing retail sales turnover to be used as STS indicators for final domestic demand by households. To eliminate the price effect on turnover, a deflator of sales is used for each group of retail trade (NACE rev.2). This deflator is an index with a similar methodology to that of a consumer price index, but is adapted especially for retail trade.

Building permits issued – is an authorization to start the work on a construction project. The permit is initial phase for planning and authorization of construction prior to the start work.

Buildings are covered structures which can be used separately, built for permanent purposes, suitable for the protection of people, animals or objects. Buildings are classified into different categories: 1) Residential Buildings (Dwellings), 2) Other Buildings, which are included hotels, industrial buildings, wholesale, retail trade buildings etc.

Floor area – is the total useful area where the approved project is implemented.

Civil engineering works – are all construction not classified under the buildings: railway, roads, bridges, highways, airport, etc.

Client – is the person or structure which realize the construction.

TOURISM

Introduction

This chapter presents information on tourism statistics. Tourism has an important role in sustainable economic development, employment, increase welfare, improve infrastructure and provides its effects on the development social and environmental of the country. Tourism statistics are produced from information sources, which provide information on arrivals and departure of Albanian and foreign citizens by modes of travel with air, sea and land. Also, in the context of tourism the statistics refer and activities of visitors traveling to a destination outside their usual environment for less than a year. The main purpose of their visit is for personal purposes (holiday, visiting relatives, religious purpose etc) and business.

Main statistical findings

In the period 2012 - 2016 the number of foreign visitors entering in Albania for personal purposes was approximately 19 million visitors and represents an average of 98.8 % of the total number of visitors. The movement of Albanian and foreign citizens during this time period have a growing trend. Average arrivals of foreign citizens increased by 8.1 %, 2016 notes the highest growth by 14.6 %. At the arrivals of foreign citizens in total, the largest share with 85.3 % is coming from land. Average departures of Albanian citizens are increased 5.3 % where the highest increase was in 2015

with 8.6 % while 2013 departures recorded a decreased of 0.8 %. Also, during this time arrivals of foreign citizens from Europe region occupies most of the arrivals in total averaged 92.4 %. In 2016, arrivals from Kosovo citizens occupy 45.5 % of total arrivals of foreign citizens follow from Macedonia by 12.0 % and Greece by 8.7 %.

Source of data

Information on tourism collected from administrative sources is limited in the number of Albanian foreigners citizens who arrivals / departures from territory of the country. Information provided by the Ministry of Internal Affairs, Department of State Police.

Definitions

Arrivals and departures include all arrivals and departures persons at border points (by air,sea and land) are a concept that refers to all arrivals. A person visits several countries simultaneously in one year calculated each time a new arrivals. Visitors means a person who travels to a different place from where he lives, for a period less than 12 months and the main purpose of this trip to visit the place he is not a profitable activity.

ENVIRONMENT

Introduction

The main objective of environmental statistics is the production of user-readable statistics, standardized according to EU normative acts and suitable for use in policy-making and environmental impact management at country level and more. Environmental Statistics provide general and specific information on the environment. Statistical indicators for the environment are generally produced at annual frequency and represent values of environmental indicators at the national level. Data are collected for the following indicators: air quality (SO₂, NO₂, O₃, LGS, PM₁₀, CO, Pb), data on GHG and other atmospheric emissions, land management in contaminated areas (hot spots), urban solid and inert wastes, imported and used pesticides in agriculture, total water balance in Albania, river waters, lake waters, bacteriological contamination of sea waters on the beaches of Albania, etc.

Key findings

“Air pollution” The content of certain pollutants in the air has generally been declining but have different origins and effects which cannot be calculated generalized indicator for pollution in total. The growth of LNP indicator caused mainly from burning hydrocarbons and less from constructions tends passing several times the accepted norms of the EU and WHO.

“Urban waste” The amount of waste at national level, reflecting urban lifestyle, had many fluctuations during the last years, the average amount of waste is more than 1 million tons for year. In 2016 total amount of waste treated was 1.3 million tonnes, showing decrease compared to the previous year. Tirana is the prefecture that has the highest

percentage of urban waste treated by 37 %, followed by Durres by 12 %, and Fier by 11.5 %, maintaining generally the linear correlation between the waste and the residents. In nationwide level are managed about 452 kg urbane wastes for capita in last year by which 373 kg/capita are household waste and similar. The difference 79 kg/capita are industrial waste mixed to urbane waste.

“The water of rivers and lakes” According to the data collected and UNECE classification, generally rivers and lakes in our country have shown to be of good quality. In 2016 the rivers with the highest quality, according to the monitoring stations were, Drini i Zi in Topojan and Vjosa in Çarçove while the river with the worst water quality is Gjanica in the spot where it joins with Seman River.

“Swimming waters, the beaches” Measurement of water quality at beaches consists mainly in the recognition of the main pollution indicators es “FC” and “IE”. In 2016 it appears that the most polluted beaches are at Shkëmbi i Kavajës in Durres and at Naval School in Vlora. Over the years, the water quality has shown an improving trend and the beaches with the best water quality are in Velipojë Shëngjin, Dhërmi, Himare and Borsh.

“Erosion” as one of the main forms of land degradation is quite visible in the main Albanian areas. The main factor which is degrading land in Albania is heavy forestry damage followed by abusive constructions. The consequences are massive flooding and water lack in natural resources, reduction of hydropower capacity basins and roads damage.

“Pesticides” over the years the amount of imported pesticides has been incised however the trend of imported quantity has noted oscillations.

Definitions

"Pollution" is any substance presence of which, directly or indirectly modify the qualitative environmental conditions by their presence.

"Air pollutants" means any rigid substance or gas that joins a hovers in the air and has dangerous effects on the human and other present alive health by living conditions modified.

"Atmospheric pollution" is a complex phenomenon that occurs with major qualitative changes in time and atmosphere space.

"Waste" means substances or objects; result of human activity or natural cycles intended to be not deseeded for proprietary. Waste is the substances which result from the life activity of households and any other waste which by the nature of the composition are unlike. Hazardous wastes are waste which stimulates damage with their presence in on the place. They contaminate directly or indirectly heaving so negative impacts on the lives of sentient beings due to the content in them to chemical ingredients, bacteriological, radiation or other properties very harmful for human and environment.

"Water" in these statistical concept is the current presentation of the balance sheet total quantity of water on and under terrestrial despite, their use for different purposes in the economic and other interests of human life, Potable water, industrial water, water for construction, water for irrigation waters with recreational uses, for energy production, transport, etc. constitute a national asset under basic precautions for human activity.

"Drinking water" means water destined for use by people, which included water treated or untreated, intended for drinking, cooking, preparing food items and hygiene needs, regardless of their origin and whether are supplied from a distribution network, public or private, deposits, tanker trucks, individually or collectively wells or packaged

in bottles or containers, the water used in enterprises producing food, foodstuffs originating in the water, the water supplied for use by people as part of a commercial or public activity, est. Water consume represents the volume of water, which did not immediately turn into water bodies.

"River" is an internal body of water with water in most cases of it flows over the surface of but at a fraction of its flow may flow underground. The most common indicators for assessing the quality of lake and river water are organic ingredients, nutrients, inorganic nitrogen, inorganic matter, suspended matter, dissolved oxygen, chemical oxygen needs, different forms of nitrogen, conductivity, beta radioactivity, total phosphorus est.

"Lake" is an internal body surface waters and groundwater sustainable.

"Coastal waters" are surface waters that are inside an imaginary line, which is equidistant to each sides at 1 nautical mile from the exterior of the nearest point of the baseline and serving as a reference for the extent of territorial waters and eventually spread to the outer limit of transitional waters.

"Erosion" is a phenomenon of nature, mainly erosion the transportation of soil mainly ground under the violent action of water or wind. Determinant factor with the main contribution of soil erosion, except nature is human activity, construction, agriculture, tourism, and above all the reduction of surfaces covered by biomass. In Albania forests damage is the main factor that causes soil erosion.

"Pesticide" means any substance or mixture of substances that aims to prevent, destroy, remove, or reduce the effect of primitive organisms, insects and animals damaging property, environmental, health or the creature with human interest.

GENERAL BALANCE OF ENERGY

Introduction

General annual energy balance presents the current situation on energy sector in Albania. The annual balance of energy is an overview of all available balances of energy resources and is fully compiled since

1998. It presents the origin and the specific use by energy sources and the energy balance is shaped in two main parts, the supply and consumption of energy.

Fig. 1 Production of primary energy by years

Main findings

Supply part is estimated as the energy flow as long as the total production corresponds to the “visible consumption”. The ratio between the total domestic energy productions with the total energy consumption, determines the level of energetic independence of the country in national level and by source of energy.

Consumption of energy or the energy flow calculated as amount for “final use” or otherwise after use for “intermediate” (after transformation). Some changes are noticed in the structure of final energy consumption by activities for the years 2012-2016. These changes are more apparent in the industry and energy consumed by households, commerce, public authority, etc.

Fig. 2 Structure of energy consumption by branches

Source of data

The general annual energy balance sheet for the country is presented in kilo ton oil equivalent (ktoe) and the data are provided by National Agency of Natural Resources.

Definitions

Gross inland consumption is equal to: Production + Import - Export - Stock Change.

Stock \pm measurement covers the the state of producers, importers, transmitters, transformers and final users of energy, when they are recognized.

Final energy consumption is the energy supplied to the final users, according to the origin and all kinds of energies without limitations.

Final non - energetic consumption calculates the use of energy as raw material for non - energetic consumption.

Primary energy is the gross energy after being obtained excluding transformation (lignite, crude oil, natural gas, hydro or nuclear energy, etc).

Secondary energy is the energy obtained through transformation of a primary energy or a secondary one (particularly the electric energy produced by thermal energy).

BALANCE OF ELECTRIC POWER

Introduction

The balance of electric power is the main source of the electricity data in our country. The main electrical operators in the country are KESH a.s, OSHEE A.S and OST a.s.

The net domestic production of electric power during 2016 was 7,136 GWh from 5,866 GWh produced in 2015, which increased by 21.7 percent.

Fig. 1 Available electricity, net domestic production, gross import and export

The increase of production of electricity during 2016 resulted on decrease of gross imports including exchanges by 22.4% and increase of gross exports by 95.5 percent, compared with 2015.

The quantity of electricity produced in 2016 was 7,136 GWh, where public hydropower plants production represents 71.4 percent of total net domestic production, while production of electricity from independent power producers constitutes 28.6 percent.

Fig. 2 Electricity exchange

Total network losses decreased by 9.6 percent, from 2,196 GWh in 2015 to 1,986 GWh in 2016 impacted from the losses in distribution, (-11.8 percent) and constituted in 90.4 percent of total network losses. Transmission losses increased by 31 GWh, from 159 GWh in 2015 to 190 GWh in 2016.

During 2016, **network losses were** 1,986 GWh from 2,196 in 2015 decreased by 9.6 percent.

Losses in distribution, during 2016 decreased by 11.8 percent compared with the same period of previous year. **Transmission losses** are increased by 19.8 percent and constitute 9.6 percent of total network losses.

Fig. 3 Consumption of electricity, electrical losses and consumption of electricity by domestic users

The consumption of electricity by domestic users, during 2016 was 5,108 GWh from 5,069 GWh in 2015. During 2016, this indicator increased by 0.8 percent compared with the previous year. The consumption of electricity by households increased by 2.6 percent in 2016.

The situation differs for the final consumption of electricity consumed by non households, which decreased by 1.0 percent compared with 2015.

Fig. 4 Consumption of electricity by domestic users

Source of data

Balance of electric power provides statistical information on domestic production of electricity, electricity exchange, losses in network also the usage of electricity for final consumption in our country. The publication of electric power balance is produced twice per year, based on monthly data collected from administrative sources as:

- KESH a.s., a state joint stock trading company, vertically integrated, which has the leading role and is the key producer of electricity in Albania;
- OSHEE a.s., a public company with 100% state-owned shares that carries out the supply and sales of electricity also the operation and management of the distribution network;
- OST a.s., transmission system operator is a public company with 100% state-owned shares that operates in the electricity transmission system from the physical and distribution concepts. OST a.s. provides the necessary transmission capacities for:
 - the supply of uninterrupted electricity for Distribution System substations (OSHEE a.s.) and electricity customers directly connected to the transmission network;
 - the transmission of electricity produced from domestic sources;
 - also transits and necessary exchanges with other countries in the region.

Definitions of basic indicators

Available electricity refers to the quantity of electricity generated by domestic production of electricity plus total amount of electricity exchange.

Net domestic production of electricity is equal to the gross electricity production from thermo plants, hydroelectric plants and other producers less the electrical energy absorbed by the generating auxiliaries and the losses in the main generator transformers.

Thermo electricity refers to electricity produced by thermo plants.

Hydro electricity refers to energy of water converted into electricity in hydroelectric plants.

Losses and own consumption is the total plant's consumption in generation process and production losses.

Independent power producers refer to private electricity producers which consist of private plants and concession contracts with the Republic of Albania. These producers are directly related to the transmission system and are licensed by the Energy Regulatory Entity (ERE) and may sell capacity or energy to OST and OSHEE, to cover losses in transmission and distribution system, as well as to other clients.

Other producers refer to electricity production from other energy sources, excluding hydro and thermo electricity.

Electricity exchange refers to the difference between imported and exported electricity, also including transits and necessary exchanges of electricity with other countries in the region.

Consumption of electricity refers to the total quantity of electricity consumed by final users and losses in networks. It is equal to the sum of the following categories: electrical losses and consumption of electricity by domestic users.

Electrical losses refer to losses in transmission network including own consumption in transmission and distribution losses. Technical losses in distribution are estimated by OSHEE a.s. Non technical losses refer to the difference between total losses in distribution and technical losses in distribution and are added also statistical differences which derive from the differences in the period of measurement in production, consumption and trade of electricity.

Consumption of electricity by domestic users refers to the quantity of electricity consumed by final users and is calculated as the sum of the consumption of households and non households.

Households refer to the quantity of household's electricity consumption.

Non households refer to the electricity consumption quantity that are not consumed by households but include the consumption of electricity by industry, transport, agriculture, public services, etc.

¹Breakdown of technical and non-technical losses are estimations made by operators in the field of electricity

²Non technical losses refer to the difference between total losses in distribution and technical losses in distribution and are added also statistical differences which derive from the differences in the period of measurement in production, consumption and trade of electricity

TRANSPORT

Introduction

This chapter presents data on transport statistics. Transport statistics describe the main features of transport not only in terms of quantity of goods, the number of passengers who move each year, the number of vehicles and infrastructure used, but also the contribution of transport services in the economy as a whole.

The collection of data is based on the Law on Statistics, in 2017-2021 Official Statistics Program (OSP), and the regulations of the European Commission on Transportation statistics. The transport statistics provide data from administrative sources and covering all modes of transport. Produced statistics based on the data on the number of passengers and amount of freight, infrastructure, number of vehicles and accidents. Data on the number of passengers reflects the trend of passenger movement in our country by travel mode by rail, sea and air. Freight statistics provide information on goods transport sector in our country through three land modes of transport (rail), sea and air.

Main statistical findings

In the period 2012-2016, the average annual number of passengers traveling by railway lines decreased 30.4 %, with

maritime lines increased 4.3 % and the airlines is increased 6.5 %. So, it is observed that between three modes of movements passengers the air transport resulting large increase in the annual average number of passengers. In 2012 -2016 period, the number of passengers moving with railway lines was 45,591 thousand passengers per km. In this period, the annual average number of passengers per km is decreased by 31.3 %, followed with a decreased in passenger numbers per thousand inhabitants from 6 in 2012 to 1 inhabitants in 2016. During period 2012-2016 number of passengers who travel by maritime lines was about 5.7 million people, including Albanian and foreign passengers. During this period the highest number of passengers per thousand inhabitants was recorded in 2016 with 448 passengers, where for five years the average was 393 passengers per thousand inhabitants. In the period 2012-2016, in the airport of our country have developed activity in air lines 16 company. During this period, the number of passengers traveling with airlines was about 9.3 million passengers. In air transport, the number of passengers has been tendency increasing over the years, from 574 passengers per thousand inhabitants in 2012 to 744 passengers per thousand inhabitants in 2016.

Fig. 1 The number of passenger in railway maritime and air transport

Freight transport

The length of the railway line in 2016 is 334 km by 399 km that was in 2012. In the period 2012-2016, the railway transport of goods increased on average 6.8 %, while the transport of goods in tones per km decreased averaged 9.9 % over the same period. In 2016, the volume of loading and unloading is decreased on average 2.2%, compared by

2015, while in the period from 2012 to 2016 the volume is decreased 1.4% averaged. Transport of good and mail by air in the period 2012-2016 has been on average 1,803 tonnes of cargo and 433 tons of airmail. 2012 marks the largest quantity of goods transport with air lines with 1,845 tons while in 2014 the postal service has highest value with 480 tonnes

Tab.1 Railway, sea and air freight transport

Years	Rail freight transport	Rail freight transport	Maritime loading and unloading	Air freight transport 000/ tonnes	Post
	000/tonnes	000/tonnes	000/tonnes	tonnes	tonnes
2,012	25,307	142	3,984	1,875	386
2,013	22,975	151	4,001	1,778	386

2,015	23,125	198	3,840	1,766	463
2,016	8,827	76	3,756	1,751	449

The number of vehicles of road transport

During the period 2012-2016, the average number of road vehicles for passengers is increased averaged 10.0 %, where the largest increase was recorded in 2013 by 13.8 %, Their number per thousand inhabitants was 113 vehicles in 2012 to 167 vehicles in 2016, where the average annual number during this period is 141 vehicles per inhabitants. In the total number of passenger vehicles, the largest share with

91.1% occupies the average passenger cars. The average number of cars per inhabitants during the same period was 129. In 2016, it recorded the largest increase in the number of vehicles with 152 cars per thousand inhabit. Vehicles of road transport for goods during the period 2012-2016 had a growth trend of 6 %. In the total number of goods vehicles the biggest part occupied road tractors and trucks by 90.1 %

Tab. 2 Vehicles of road transport for passengers and freights

Accidents

Accident statistics covers the number of accidents and killed that occur in road transport and rail. Safety is the key issue of any kind of transportation. Road accidents are very present in our days where remain people killed and injured. Reasons for the possibility of occurrence of accidents are such as: quality of infrastructure, climatic conditions, geographical and population density. Also the behavior of drivers a reason for the possibility of occurrence of accidents as; lack of experience, the speed on allowed norms, lack of traffic regulations, consumption of alcohol, etc. In 2016 the

number of road accidents has increased by 2% compared with 2015. During the period 2012-2016 the average number of killed from road accidents was 286 people. 2014 was the year with the lowest number of deaths from road accidents with 264 people. During the period 2012-2016 the average number of railway accidents there were 22 accidents. Year 2014, marks the lowest number of injured persons with 6 people. Also, the number of dead persons in 2014 was 1 person, from 2 dead that is their average number.
